10 BRANDS
Decades of commitment to quality and service

There are **three** basic types of **Zones** related to **all** buildings,
This Includes, Hotels, Shopping Centres, Offices, Airports, Hospitals, Apartment blocks, Courts, Libraries, etc

Why Matting in these three zones is So Important.

1. Protect flooring in the building from damage. Stones and debris that can get lodged into grooves of shoes can scratch & damage flooring. Replacement would be very costly vs **Entrance matting cost.**
2. Reduce the amount of cleaning needed to keep entrances neat and safe. If dirt is walked into buildings all day, cleaning would be needed throughout the day. Floor damage and all day entrance cleaning vs **Entrance matting cost.**
3. Reduce the amount of wet floors as this creates a slip and fall hazard which increases the insurance bill and chances of a lawsuit. If the Entrance management System is well thought out, the floors can be cleaned in convenient times which improves traffic flow during working hours vs **Entrance matting cost.**

PROTECT YOUR FLOORS
& AVOID LIABILITY

3
ZONE
CLEANING

ZONE 1

ZONE 1 / EXTERNAL EXPOSED / SCRAPING ZONE

As you can see, this is an external zone and it is not protected by a roof or other structure, or the protective structure is small and doesn't protect an entrance management system. The floor at this entrance is exposed to all types of weather.

ZONE 2

ZONE 2 / EXTERNAL COVERED / SCRUBBING ZONE

This is also an external zone, but there is a protective roof structure in the design, so the entrance is well protected from weather. This is sometimes called the Transitional Zone as you transition from outside to inside the building.

ZONE 3

ZONE 3 / INTERNAL / CLEANING ZONE

This is the final zone and it is internal, so completely protected from weather.

There are **three** basic types of **Zones** related to **all** buildings,
This Includes, Hotels, Shopping Centres, Offices, Airports, Hospitals, Apartment blocks, Courts, Libraries, etc

3 **ZONE 1**
ZONE CLEANING **EXTERNAL EXPOSED / SCRAPING ZONE**

EXTERNAL EXPOSED / SCRAPING ZONE

With this Zone we need to think about the areas outside the building and what types of dirt the person will walk over before entering the building. If it is a cement based or tarmac parking lot, a sidewalk or walkway then there will be small stones and debris as well as dust or mud, depending on the weather. People will also probably use umbrellas which will be wet and will expel water when shaken and closed before entering. The worst-case scenario is small stones and dust or mud with excessive water. Tiled walkways will have less larger debris but dust and mud would still be an issue. It would be very beneficial to start with a Scraping Mat that will remove stones, dust and mud from shoes as the person walks over the mat and scrapes their feet. This mat must be around 2-3 meters long, in walking direction, to be effective so that the person gets as many steps/scrapes in as possible before getting to the External Covered/Transitional Area. We need to remove as much heavy dirt as we can outside the building.

The other consideration is that the system must trap and hold the dirt inside the mat to avoid multiple people just transferring that dirt into the building if it sits on top of the mat. Holes gaps and bristles are important. The deeper the mat, the better in heavy traffic areas. Thinner, cheaper options in medium to low traffic areas. So, the specification must look for a balance between cost and effectiveness of the system.

**PROTECT YOUR FLOORS
& AVOID LIABILITY**

3 **ZONE 2**
ZONE CLEANING **EXTERNAL COVERED / SCRUBBING ZONE**

EXTERNAL COVERED / SCRUBBING ZONE

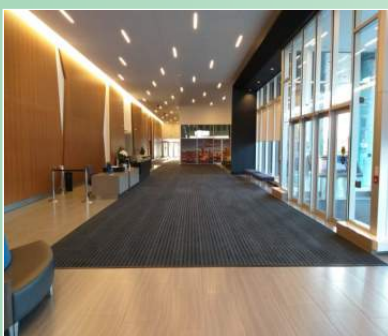

In the External Covered or Transitional Zone, the area is well under-roof and cannot be rained on. The person should have scraped feet in Zone 1 and should only have residual dust, mud or water on shoes. In this Zone we want to scrape that dirt from shoes and the material type here is normally bristles or textile on the mats. These bristles and the loop in the textile Scrubs the bottom of shoes and removes the dirt and traps it inside the fibers or between bristles.

The longer the walking direction, the better chance of removing most of the residual dirt. The depth of the system also depends on the amount of traffic. Deeper options for more foot traffic.

If there is no room for an External Exposed system, then this becomes the first Zone for cleaning footwear and there can be just Zone 1 options, or a combination of Zone 1 and Zone 2 solutions to make an effective Entrance Management System.

Understanding the Zones and what dirt needs to be cleaned, makes the selection easier when 3 Zones cannot be achieved.

**PROTECT YOUR FLOORS
& AVOID LIABILITY**

3 **ZONE 3**
ZONE CLEANING **INTERNAL / CLEANING ZONE**

INTERNAL / CLEANING ZONE

The final Zone is obviously there to remove the last of the water, dust or mud from shoes.

The Entrance Management System is successful if very little, to no dirt, is transferred onto the flooring when entering the building.

This is normally achieved if the Entrance Management System is equal to, or exceeds 6 meters in length with a combination of surface types to; Scrape, Scrub and Clean shoes.

The Internal Zone can have aluminium mats with textile inserts; inside matwells or laid loose with ramp edges, or by using Industrial size and strength textile/carpet mats. Depending on the layout inside the building, they can use standard mats with factory edging all around, or specify special sizes to match the layout; walkways, ramps open areas etc. These mats can offer Scraping and Cleaning or just Cleaning, depending on what was achievable in the other Zones.

These textile/carpet mats will clean and dry shoes and remove the last bits of dirt that remain on the footwear.

Quality Door Insulators

Aluminium Rubber Seal Door Insulator

CODE: MSASR.BZ,S

DESCRIPTION: M•Seal Aluminium Door Seal Rubber - Bronze, Silver

FUNCTION: Reduces draughts. Seals gaps between door bottom and threshold.

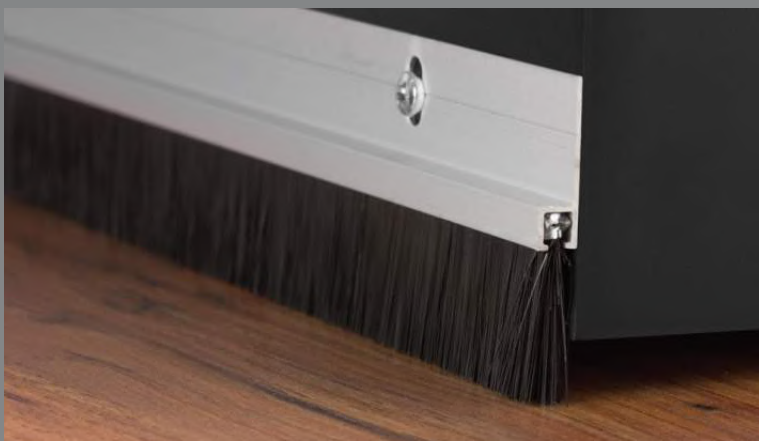

PVC Rubber Seal Door Insulator

CODE: MSPSR.07

DESCRIPTION: M•Seal PVC Door Seal Rubber – Brown

FUNCTION: Reduces draughts. Seals gaps between door bottom and threshold. Supplied with double sided tape that will stick to highly varnished, or enamel painted doors. The tape might not stick to all door surfaces. Drill and screw-fix if tape does not stick.

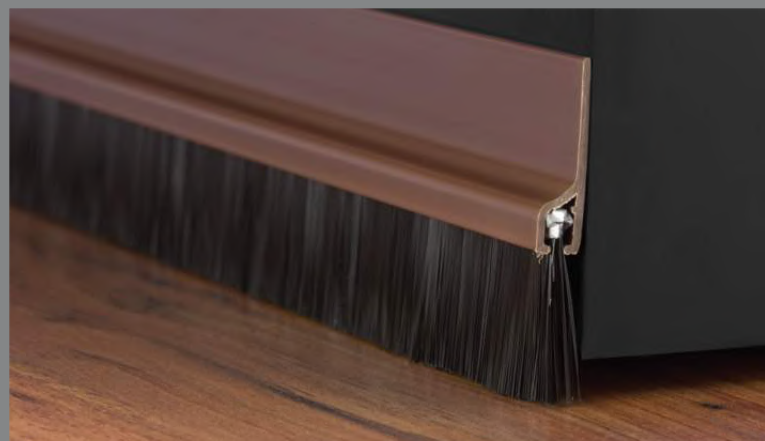

Aluminium Brush Door Insulator

CODE: MSADB.S

DESCRIPTION: M•Seal Aluminium Door Brush – Silver

FUNCTION: Reduces draughts. Seals gaps between door bottom and threshold.

PVC Brush Door Insulator

CODE: MSPDB.07

DESCRIPTION: M•Seal PVC Door Brush – Brown

FUNCTION: Reduces draughts. Seals gaps between door bottom and threshold. Supplied with double sided tape that will stick to highly varnished, or enamel painted doors. The tape might not stick to all door surfaces. Drill and screw-fix if tape does not stick.

Automatic Door Insulator

CODE: MSAUTO.BZ,S

DESCRIPTION: M•Seal Auto Door Insulators – Silver, Bronze

FUNCTION: Protects against rain, draughts, dust and pests. Seals gaps up to 15mm.

Why use MSeal Door Insulators?

1. Temperature Control.
2. Light Elimination.
3. Dust Control.
4. Sound Proofing.
5. Non-Chemical Pest Control.
