

AGI or Artificial General Intelligence is the ability to learn an intellectual task that any human or animal can do. We are very far away from true AI with the ability to mimic a human but that does not mean that we are safe.

ChatGPT is a very simple model that is very far away from true intelligence. It is just advanced pattern matching system. But that itself is enough to perform better than humans in many tasks.

People believed that the one task AI would not replace us for a long time is creativity, but more and more we see that creativity is nothing more than pattern matching with a few random changes. This is very evident in results of chatGPT or Generative Art AI like midjourney.

There are 3 major categories

- Jobs which AI will soon take over completely
 - Content Writing and creation
 - Manufacturing and assembly
 - Customer service
 - Branding and Marketing
 - Journalism and Media
- Jobs which AI can assist and improve efficiency
 - Design of all kinds - Graphic, Interior, Product
 - Software and Programming
 - Management
 - Politics
 - Collaborations
- Jobs which are far from being interfered with AI
 - Unemployment

The Question is not 'If' but 'When'.
