

# Structured cabling solutions for the data center white space

# Discover how structured cabling simplifies your cloud infrastructure

Structured cabling enables you to make the most out of your white space through straightforward and high-density fiber cable management. Our pre-selected cabling solutions maximise the performance of your setup and save you time through easy installation and reduced maintenance needs.

Our versatile and scalable solutions are ready for direct deployment into your white space. You will be able to set up a hassle-free and efficient cloud infrastructure, secure the efficiency of your investment and set your system up for growth, all while focusing on your core business.

## Optimise your space

Make the most out of your white space with high-density cable management solutions that keep it neat and organised.

## Boost your performance

Improve the performance of your system by deploying simple solutions that are easy to maintain and manage.

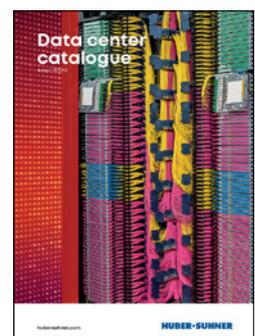

## Hassle-free procurement

Benefit from our one-stop-shop offering for cable management solutions and set up your white space with the right cabling from the get-go.

## More to explore

For more information on our entire portfolio of data center products, check out the HUBER+SUHNER data center catalogue.

[Data center catalogue](#)

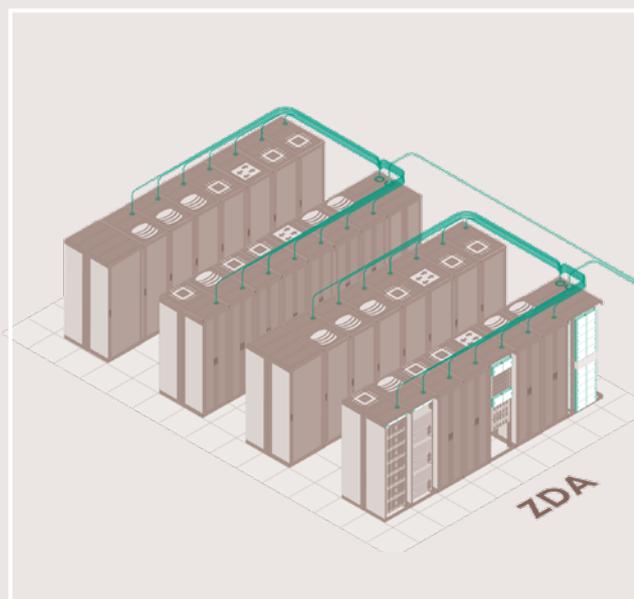

# Data center zones and areas

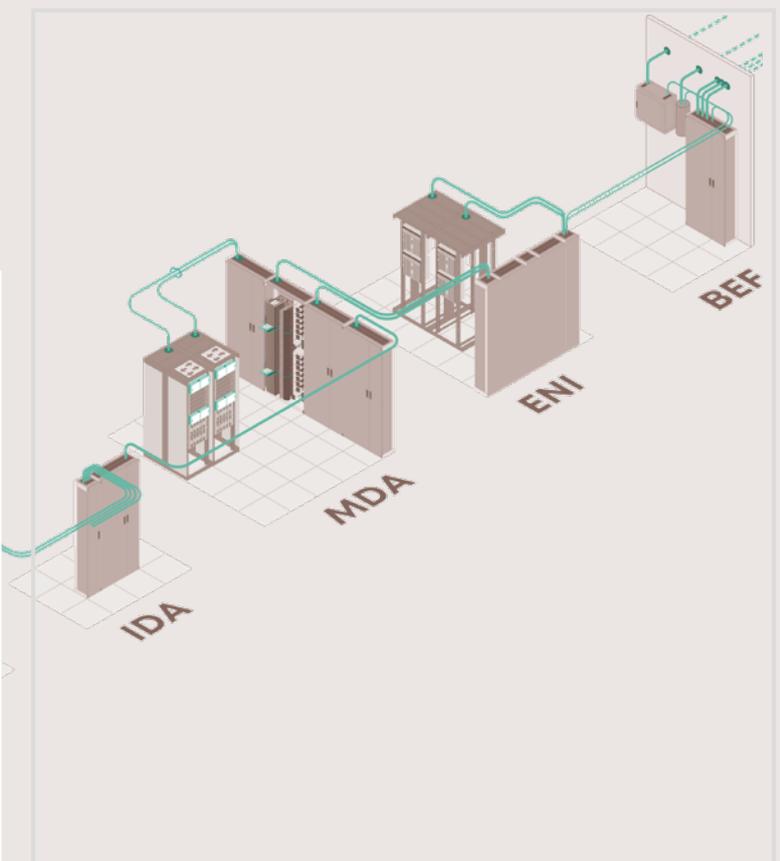

Within our data center portfolio, we offer solutions specifically developed for structured cabling in your white space. By deploying our fiber management solutions into your dedicated white space, you enable a simple, stable and upgradeable physical layer that lasts.

The white space of a data center refers to the area that holds the tenants' IT hardware for private and hybrid clouds. Grey space, in turn, is the area reserved for supporting engineering infrastructure.

Customers manage cabling in the Zone Distribution Area (ZDA). The data center operator then takes overall responsibility for the backbone cabling and connections into the ZDA. Carriers and dark fiber providers install their cables within the Meet-Me Room (MMR) or Building Entrance Facility (BEF).

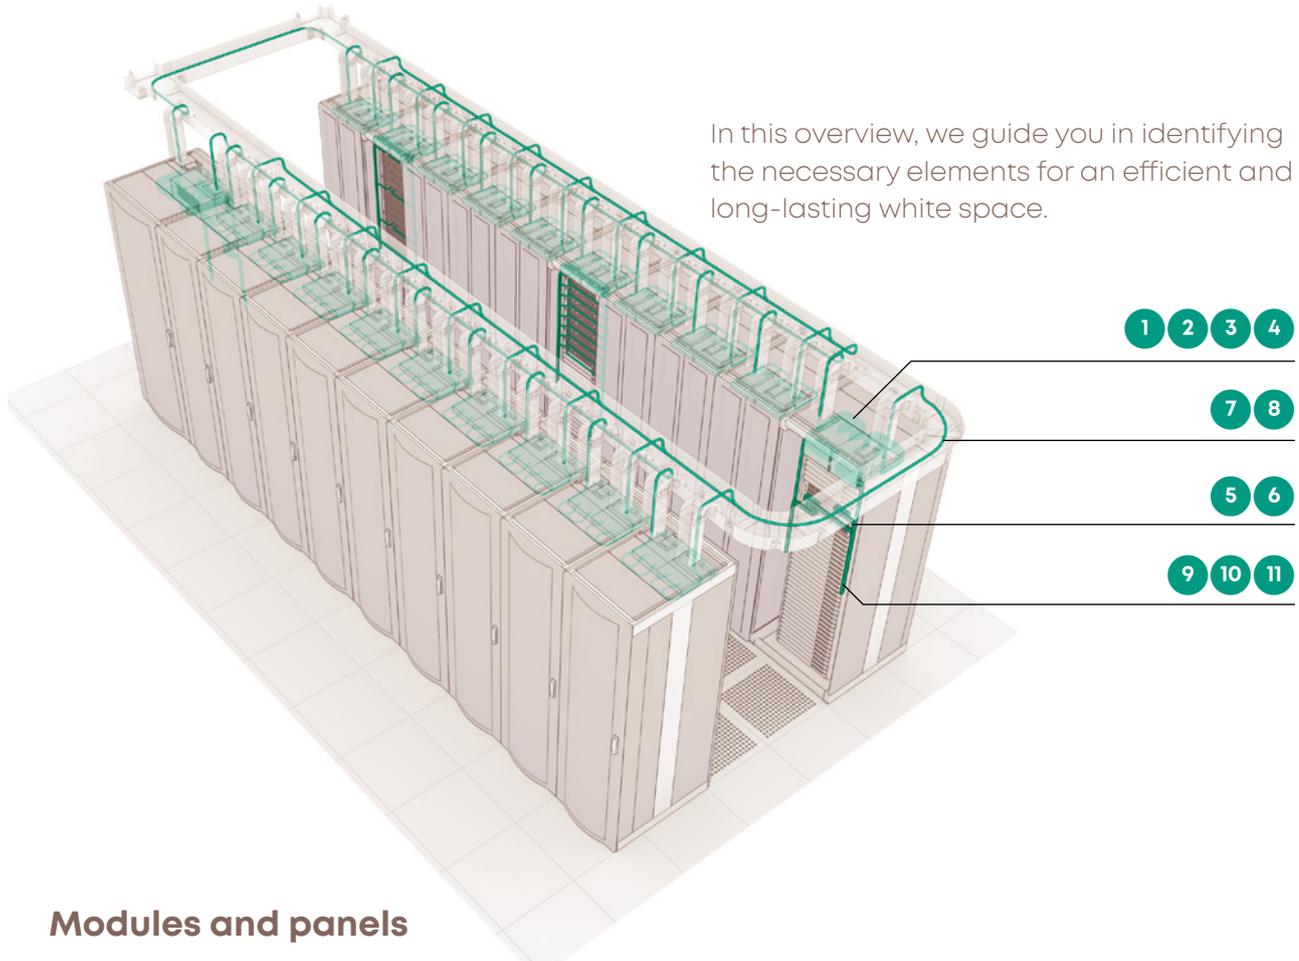

The white space

The grey space

# Elements needed to set up structured cabling in your white space

## Modules and panels

Modules are needed to build permanent links between racks. They provide adapter interfaces to the end of the cables which connect the modules. Modules come in different types and sizes. The modules you need for

your white space depends on your structured cabling scenario, the type of transceivers used, as well as your spending plan.

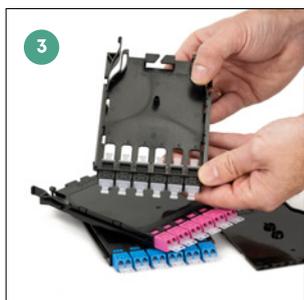

### Transition modules

MTP at the rear and LC duplex at front. To be used with MTP Pro jumpers (8). Allows rapid plug-and-go connections without the need for splicing.

### Splice modules

With LC adapter at front. To be used with all kinds of FO cables (7). Protects the spliced cables and ensures an optimal bend radius.

### Patch modules

MTP or LC both from rear and front. To be used with MTP Pro jumpers (8) and duplex assemblies (9). No splicing required.

### Patch panels and accessories

Patch panels are enclosures for modules of different sizes and numbers. Typically they are mounted on the top of the racks.

## Transceivers

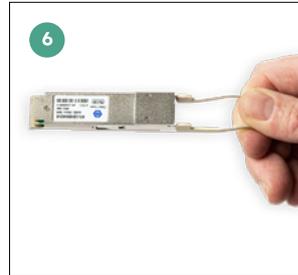

Technically speaking, transceivers are not part of structured cabling. However your structured cabling setup has to match the specifications of the transceivers in your system (type of connector, singlemode or

multimode and operating distance). The main distinction is between duplex and parallel transceivers. Transceivers are part of our portfolio.

### Duplex transceivers

Transceivers for two fibers. They are equipped with a LC duplex interface.

### Parallel transceivers

Transceivers for 8 fibers. They are equipped with a MPO interface. They are also called MPO transceivers.

## Cables

### Fiber optic cables

Different types (length, number of fibers) of cables. They need to be spliced and are used together with splice modules (2) to build links.

### MTP Pro jumpers

To be used outside the rack with transition modules (1) and patch modules (3) to build links between racks. For extra strength and better fire protections, they are thicker than MTP Pro patch cords.

## Patch cords and assemblies

### Duplex assemblies

To be used inside racks for in-rack and direct-connections and also together with patch modules (3) to build links between racks

### MTP Pro patch cords

Similar to MTP Pro jumpers (8), but to be used inside the racks.

### Harness cables

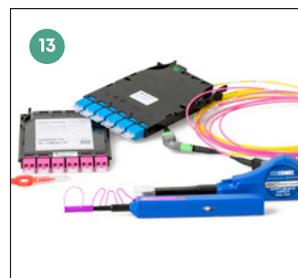

Connect parallel to 4 duplex transceivers. To be used in direct-connect breakout applications scenarios inside the same rack.

## Tools

### MTP Pro tools

Needed to adjust MTP Pro jumpers and patch cords to ensure compatibility and allow more cabling scenarios.

### Cleaning tools

Tools to clean end faces of fibers if needed.

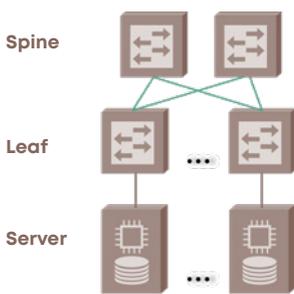

# Network architectures

Our structured cabling portfolio enables data center tenants to set up modern network architectures in their white space. The most common are top-of-rack and end-of-row cabling architecture. Both are fully supported by our portfolio.

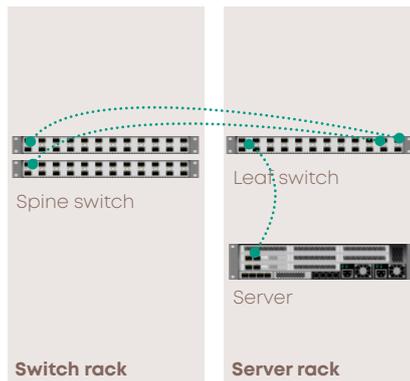

## Top-of-rack architecture

In a top-of-rack architecture, structured cabling provides the physical path for connections between the spine switch in the switch rack to leaf or top-of-rack (TOR) switches, to further connect to all servers in this rack.

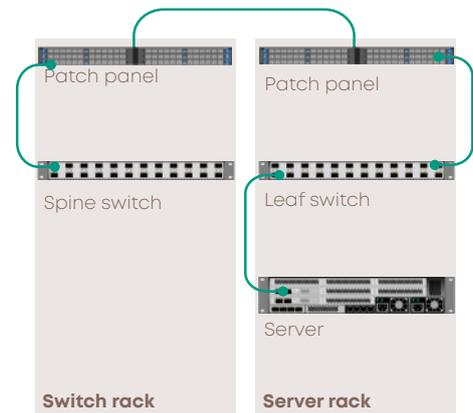

### Network architecture

### Logical connections without structured cabling

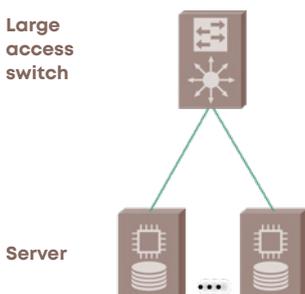

### With structured cabling

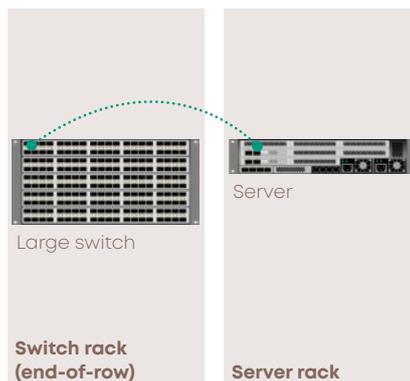

## End-of-row architecture

In an end-of-row architecture, structured cabling provides the physical path for connections between a large access switch (end-of-row) in the switch rack and servers in server racks.

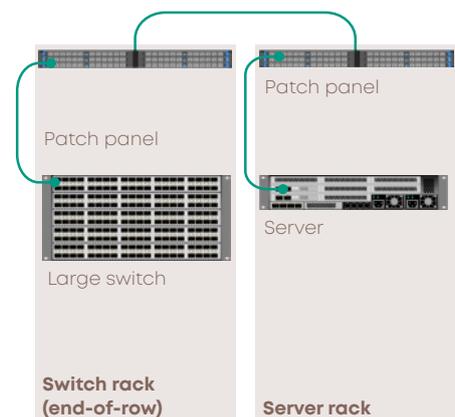

### Network architecture

### Logical connections without structured cabling

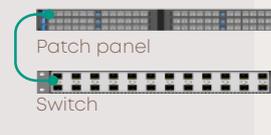

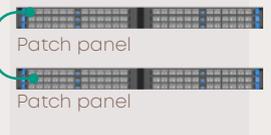

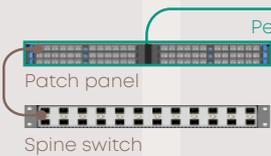

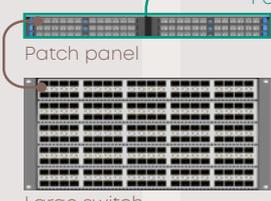

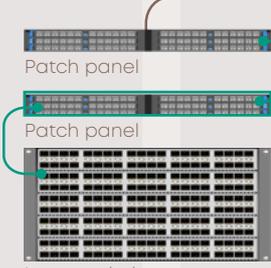

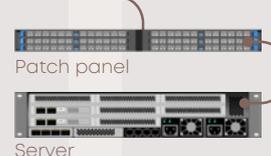

### With structured cabling

# Cabling scenarios

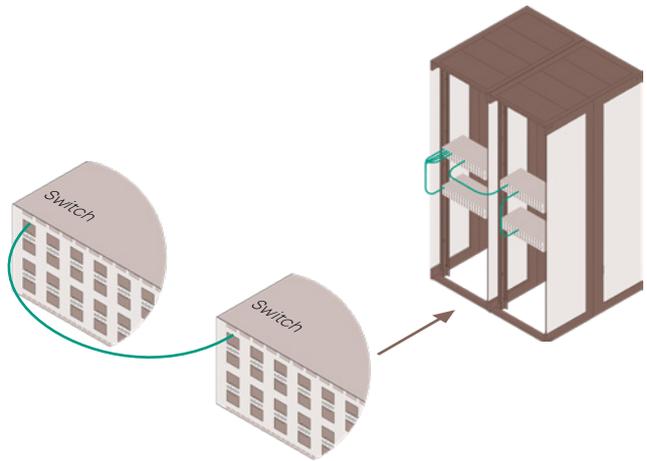

Our products allow you to set up your system in different cabling scenarios. Each scenario has its specific advantages. Depending on the scenario chosen, as well as the type of transceivers that you have in your system, you will need different products and solutions.

## Types of transceiver connections

	Duplex to duplex	Parallel to duplex	Parallel to parallel
<p><b>Direct-connect</b></p> <p>Apply this scenario for in-rack connections that connect end equipment to the panel or connect end equipment to end equipment.</p>	 <p>Switch Switch</p>	 <p>Switch Server</p>	
<p><b>In-rack</b></p> <p>In-rack connections are equipment-to-panel or panel-to-panel (called cross-) connections.</p>	 <p>Patch panel Switch</p>	 <p>Patch panel Server</p>	 <p>Patch panel Patch panel</p>
<p><b>Inter-connect</b></p> <p>Apply this scenario for connections between equipment in distanced racks by adding permanent links. For example, to connect a spine switch with leaf switches or end-of-row switches with servers.</p>	 <p>Patch panel Spine switch</p> <p>Permanent link</p> <p>Patch panel Leaf switch</p>	 <p>Patch panel Large switch</p> <p>Permanent link</p> <p>Patch panel Server</p>	
<p><b>Cross-connect</b></p> <p>Apply this scenario to add more flexibility to the inter-connect scenario by adding port extension to enhance cable management and security.</p>	 <p>Patch panel Patch panel Large switch</p>	 <p>Patch panel Server</p>	

# Direct-connect

Apply this scenario for connections between equipment within the same or adjacent racks. No patch panels are needed in this scenario.

Direct connection between equipment within the same or in adjacent racks

## Direct-connect links for different types of transceivers

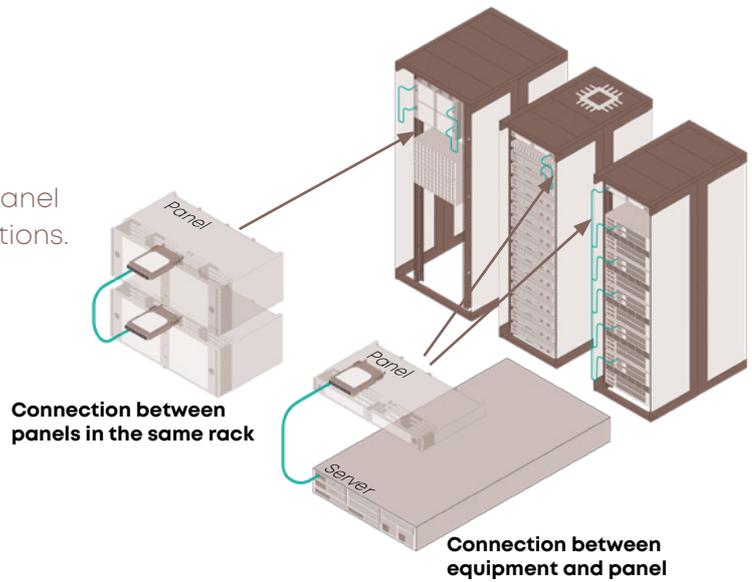

Duplex to duplex	Parallel to duplex	Parallel to parallel
<p>Switch rack</p> <p>Switch</p> <p>Switch</p> <p>Duplex transceiver</p> <p>Use duplex assembly (patch cord)</p>	<p>Switch rack</p> <p>Switch</p> <p>Switch</p> <p>Parallel transceiver</p> <p>4x duplex transceiver</p> <p>Use harness cable</p>	<p>Switch rack</p> <p>Switch</p> <p>Switch</p> <p>Parallel transceiver</p> <p>Use MTP Pro patch cord</p>

## Typical product applications

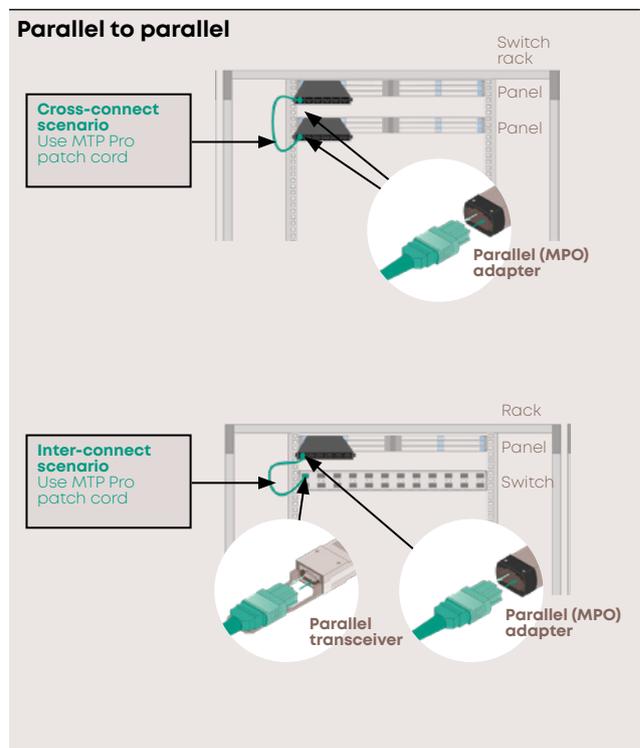

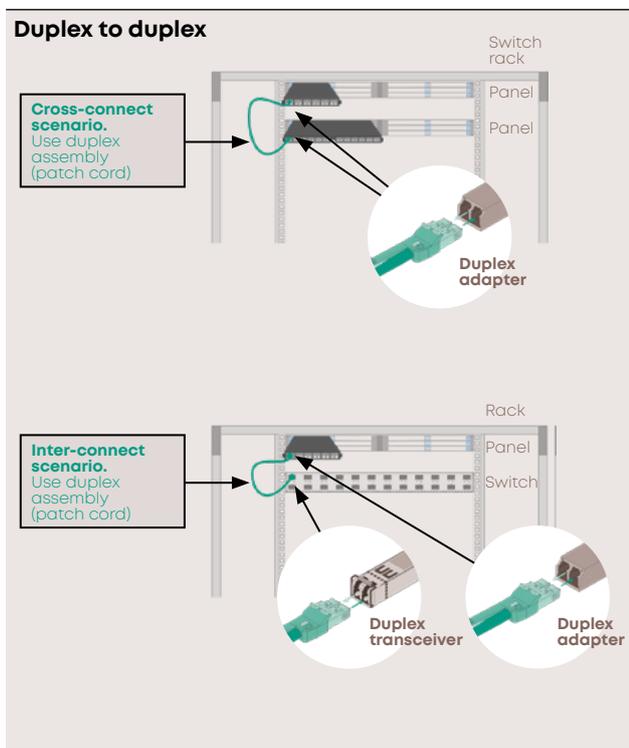

Multimode fiber	Singlemode fiber
<p>Duplex to duplex / duplex assembly (patch cord)</p> <p>5 9 5</p> <p>Polarity AB</p>	<p>5 9 5</p> <p>Polarity AB</p>
<p>Parallel to duplex / harness cable</p> <p>6 11 5</p> <p>female Polarity NP</p>	<p>6 11 5</p> <p>female Polarity NP</p>

Polarity AB or AA, see link overview

**Singlemode fiber**

Duplex to duplex / duplex assembly (patch cord)

9

Polarity AB or AA, see link overview

Harness cables are not advised for in-rack connections

Parallel to parallel / MTP Pro patch cord

10

Polarity B or A, see link overview

female female

Parallel to parallel / MTP Pro patch cord

10

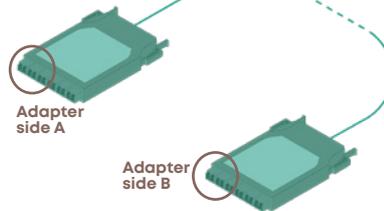

Polarity B

female female

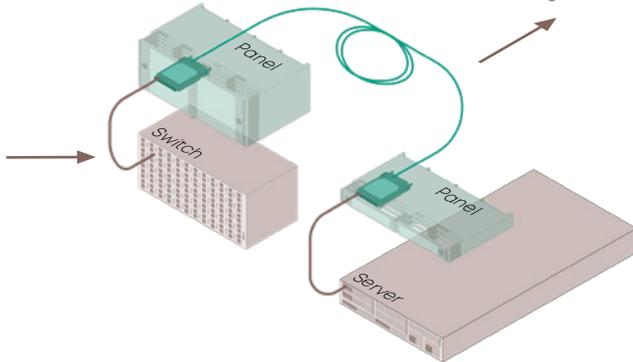

# Inter-connect

Apply this for connections between equipment in distanced racks by adding permanent links. For example, connect a spine switch with leaf switches. Or end of row switch with servers. The connection is done via panels.

**Permanent link between modules in distant racks.**

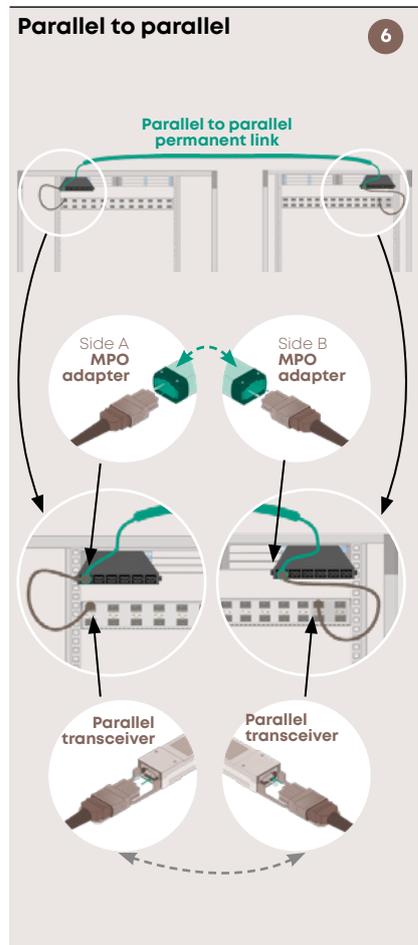

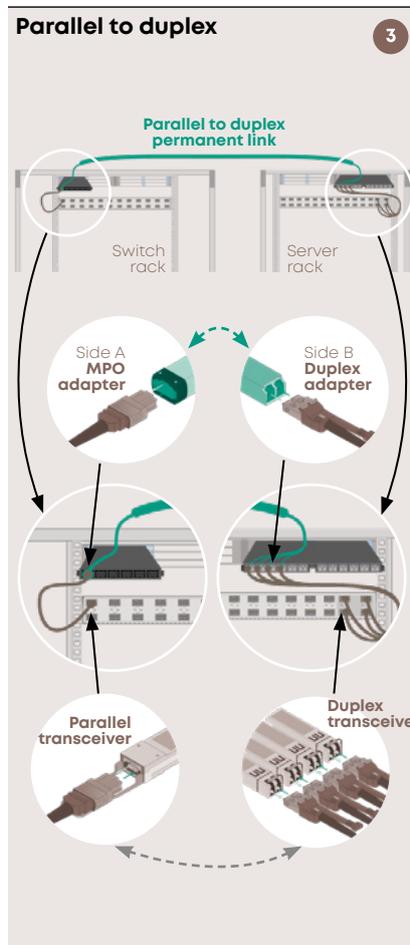

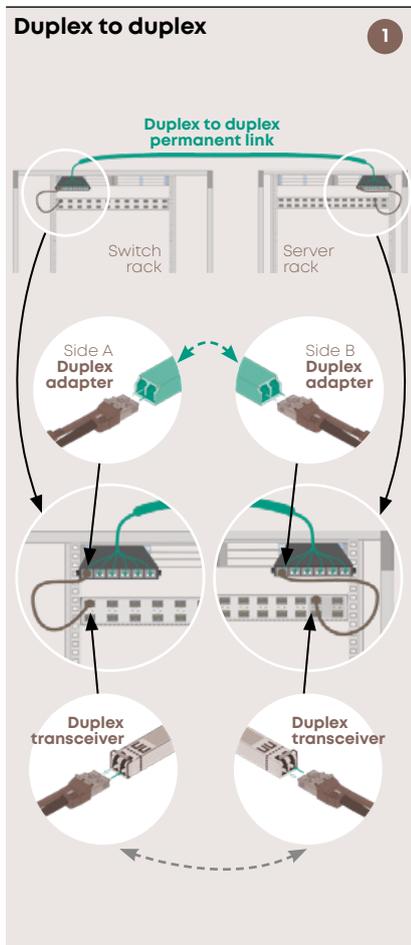

**The permanent link has adapters on both sides.**

**Distanced racks**

**Equipment in racks is connected to modules with in-rack connections.**

## Permanent links for different types of transceivers

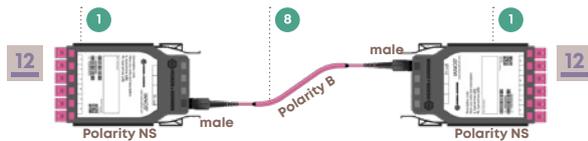

## Typical product applications

### Multimode fiber

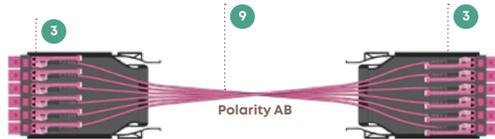

#### Duplex to duplex permanent links

Duplex adapter on both ends of permanent links  
Three ways to build.

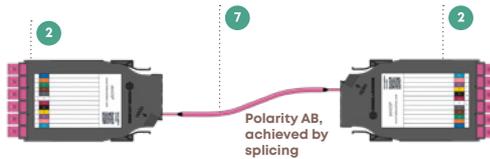

With transition modules - plug-and-go

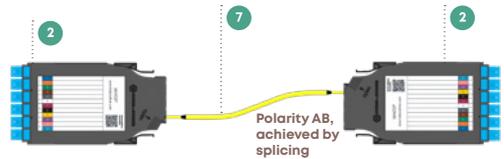

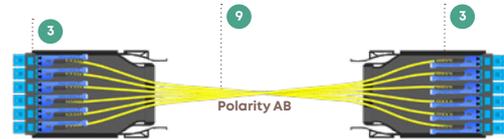

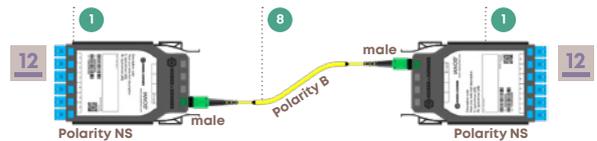

With patch modules - patch-and-go

With splice modules - splice-and-go

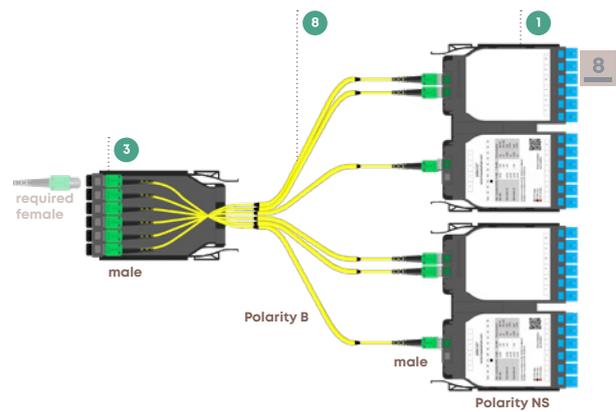

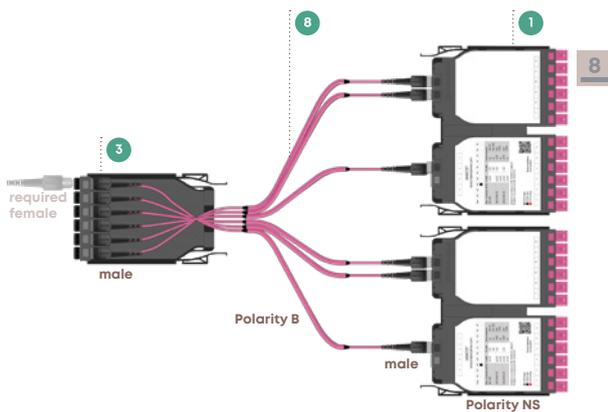

### Singlemode fiber

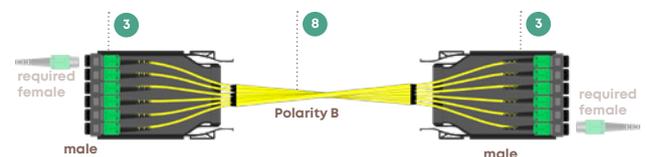

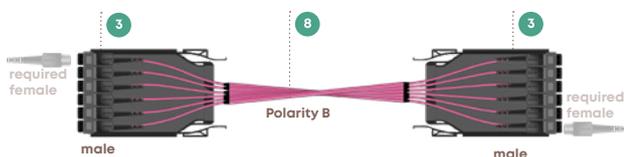

#### Parallel to duplex permanent links

MPO adapter at one end transitioned to duplex adapters on the other end of permanent links

#### Parallel to parallel permanent links

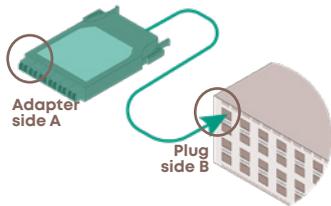

Duplex adapter on both ends of permanent link

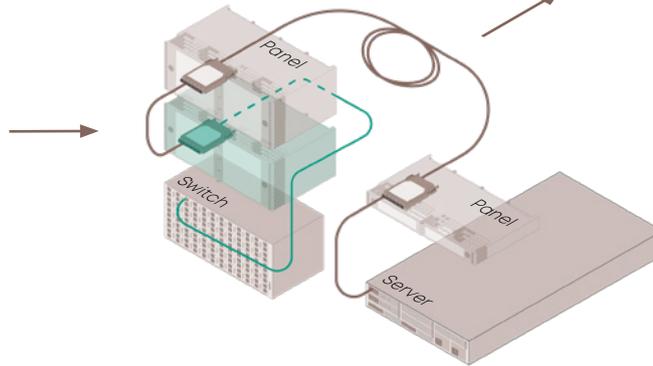

# Cross-connect

Apply this scenario for connections between equipment in distanced racks by adding port extensions. For example, to extend spine switch ports onto an extension panel to connect with leaf switches.

The switches can be located in the same or distanced racks

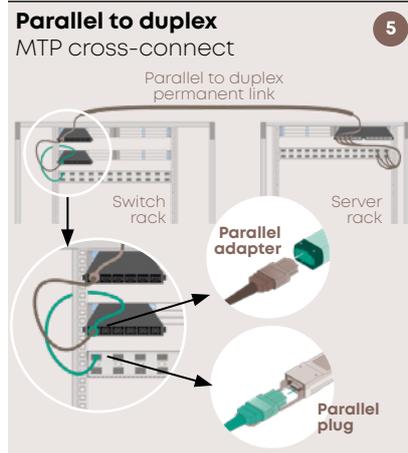

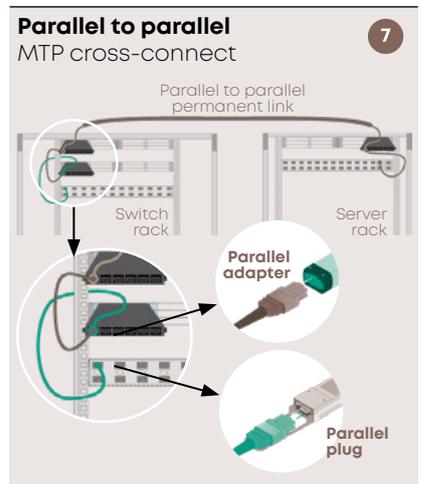

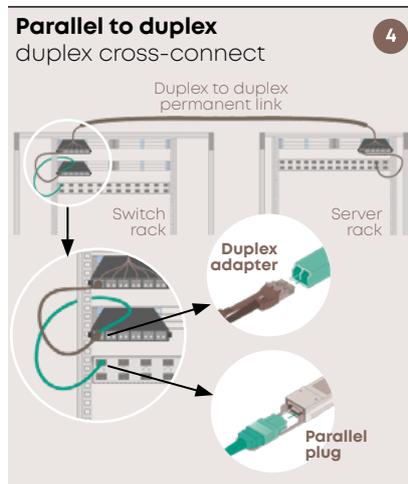

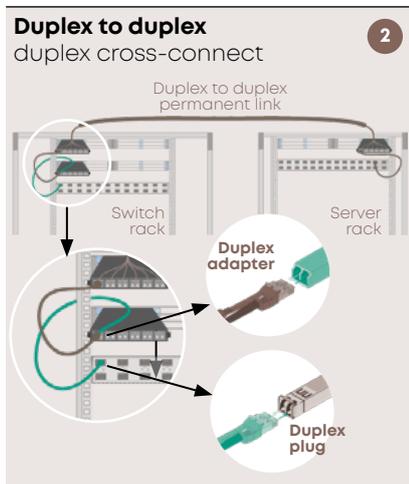

Switch ports are replicated onto a patch panel by port extension

The patch panel is connected to other equipment via permanent links.

## Port extension for different types of transceivers and permanent links

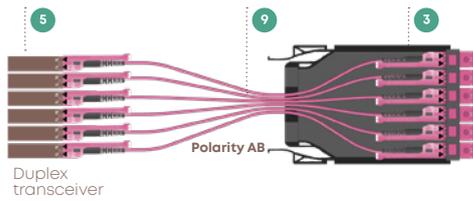

## Typical product applications

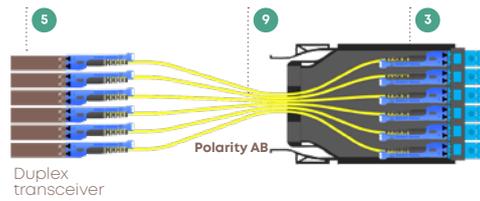

### Multimode fiber

#### Duplex to duplex port extension

Duplex plug at one end and duplex adapter on the other end of the port extension link

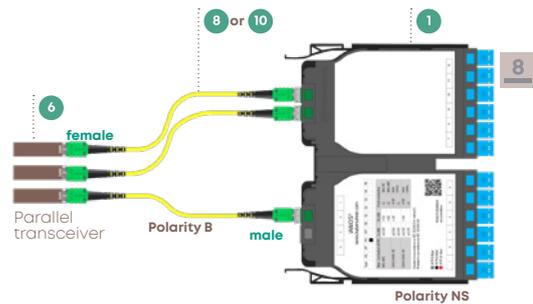

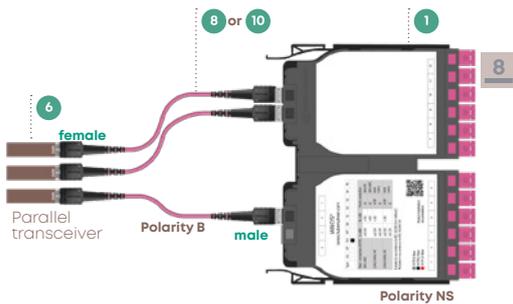

### Singlemode fiber

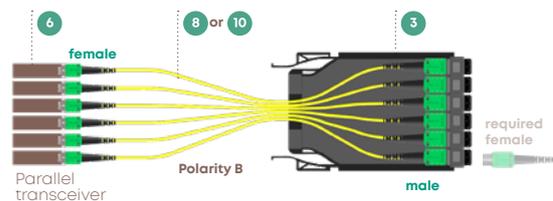

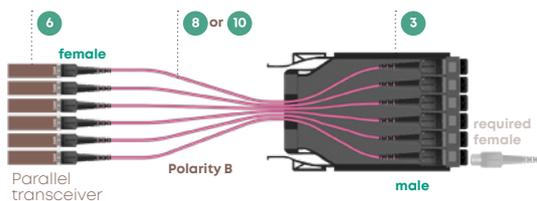

#### Parallel to duplex port extension

MPO plug at one end and duplex adapters on the other end of the port extension link

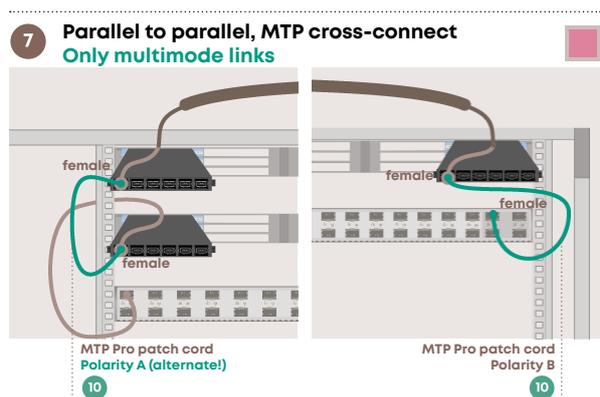

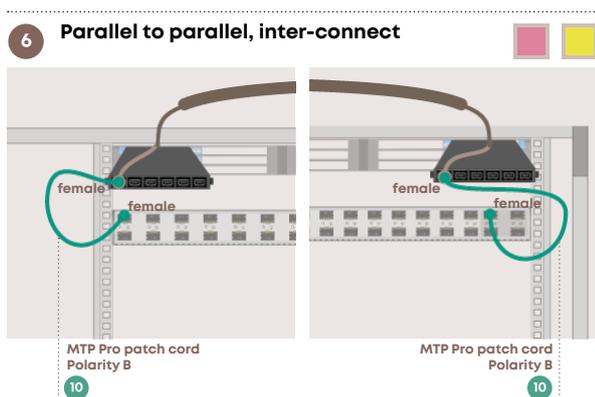

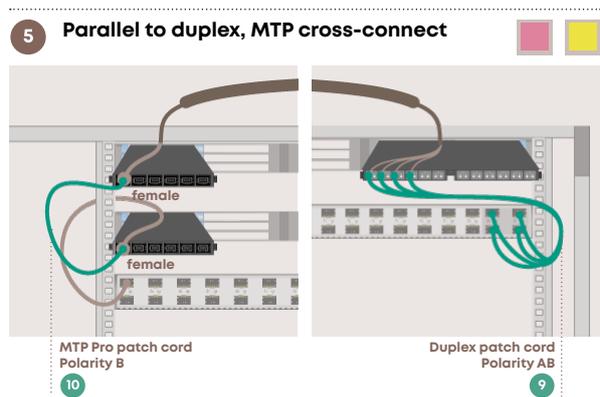

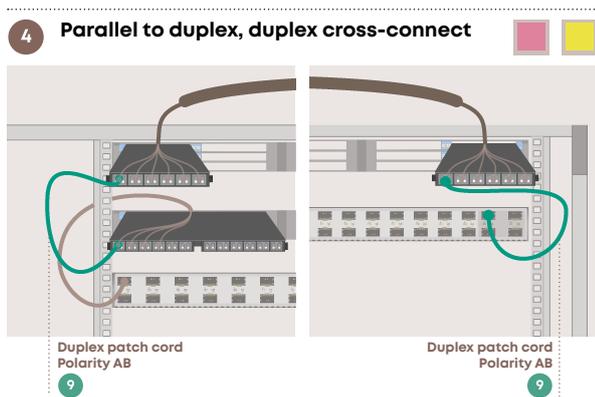

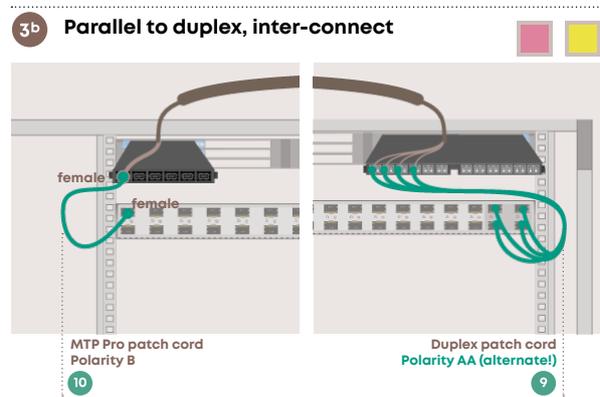

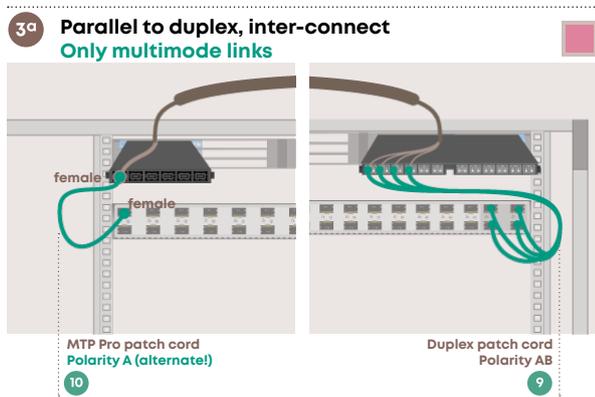

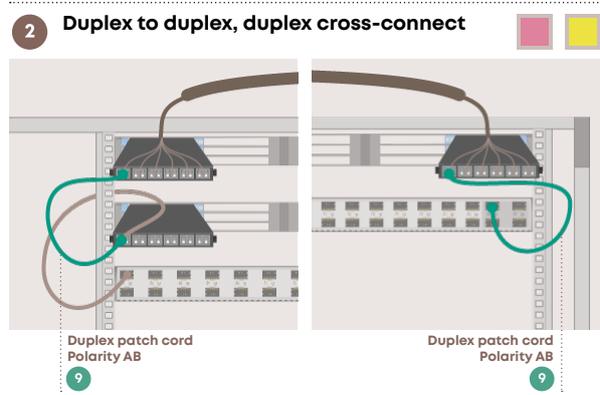

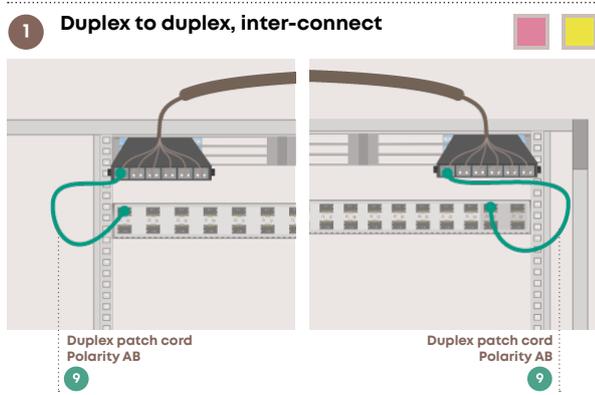

#### Parallel to parallel port extension

MPO plug at one end and MPO adapter on the other end of the port extension link

# All link design configurations

Follow these full link configurations to verify required in-rack connection and alternate polarity of duplex or MTP Pro patch cords where necessary.

# IANOS® transition module

IANOS transition modules are built using fiber optic assembly, which transitions the MTP female at the rear side inside of the module to the LC duplex on the front side. Transition modules are used to build various plug-and-play structured cabling permanent links.

Transition modules are available in single or double versions and can be of Base-8 or Base-12e methods. Base-8 transmits 8 fibers. Base-12e transmits all 12 fibers.

Modules are compatible with MTP-12 fiber jumpers of matching fiber type and require male MTP connector on the jumper side.

## Applications

Base-12e modules **12**

- Duplex to duplex permanent links, with transition modules - plug-and-go

Base-8 transition modules **8**

- Parallel to duplex permanent links
- Parallel to duplex port extension

## Features

- Fast tool-less snapping in to a chassis from front or rear
- Optical low-loss performance
- Compatible with any IANOS chassis
- Factory cleaned, tested

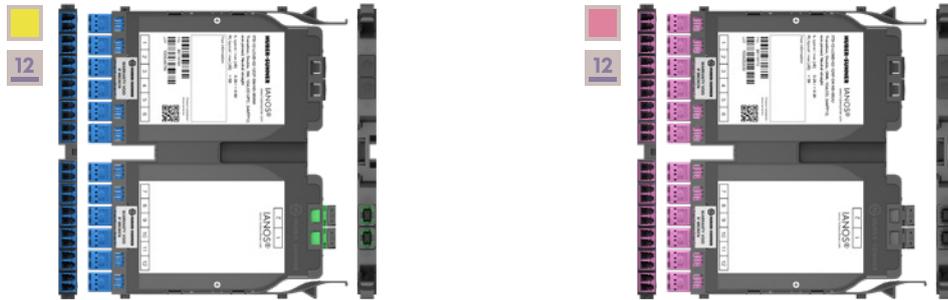

## Single transition module Base-12e

### Technical data

# IANOS® splice module

IANOS splice modules are equipped with fiber pigtails that can be fusion spliced to fiber optic cables. The design of the splice module assures a minimum fiber bend radius and fast splicing, reduced coiling time and convenient storage of bare fibers inside modules.

Modules are available in single or double size, supporting up to 12 or 24 fibers respectively. Pigtails in modules are colour-coded according to TIA, supplied with heatshrink splice protectors, and DIN colour-coded support sandwich splice protectors.

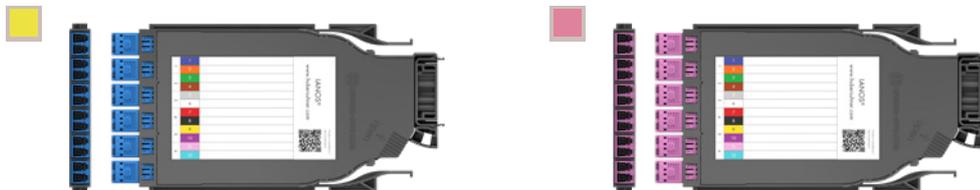

## Applications

- Duplex to duplex permanent links, with splice modules - splice-and-go

## Features

- Fast tool-less snapping in to a chassis from front or rear
- Optical low-loss performance
- Lid with fiber identification
- Compatible with any IANOS chassis
- Quick incoming cable fixation
- Bending radius control throughout

## Single splice modules

### Splice instructions

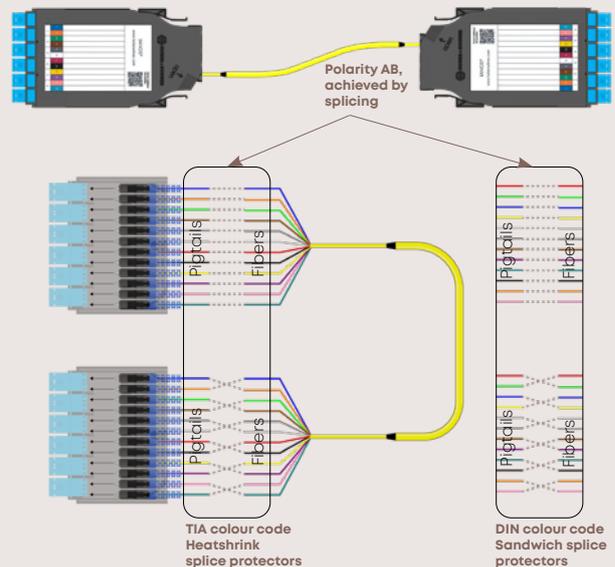

#### Pigtail colour codes

Pigtails inside splice module are inserted into LC duplex adapters according to colour code (schemes) - TIA or DIN.

#### Achieving polarity AB

To achieve polarity AB, which is required for a duplex to duplex permanent link, one side of the cable should be spliced sequentially according to the colours, while on the other side, the fibers must be spliced by flipping each pair.

# IANOS® patch module

IANOS patch modules allow MTP and LC jumpers or patch cables to be connected directly to patch cords.

Duplex patching modules provide a fast plug-and-play alternative to transition or splice termination methods, and the MPO module is designed to support various application with parallel optics.

## Applications

Duplex patch modules

- Duplex to duplex permanent link, with patch modules – patch-and-go
- Duplex to duplex port extension
- MPO patch modules
- Parallel to duplex permanent links
- Parallel to parallel permanent links
- Parallel to parallel port extension

## Features

- Fast tool-less snapping in to a chassis from front or rear
- Lid for additional identification
- Compatible with any IANOS chassis

# IANOS® chassis

The IANOS chassis accommodates various types of IANOS modules. There are two versions of chassis IANOS 1U and 4U for high-density applications with sliding layers, and IANOS 1U lite for applications where high-density is not required.

IANOS 4U are usually mounted in a network cabinet above a switch, while IANOS 1U and IANOS 1U lite are mounted on top of server cabinets.

# Duplex transceivers

Transceivers can be used in various equipment as soon as the form factors of the network card or switch receptacle are compatible with the transceiver's form factors and coding.

Listed below are the most popular Ethernet transceivers examples with LC duplex interface which are used in the white space.

Structured cabling scenarios and the possibility for future speed upgrades depend on the transceiver's interface.

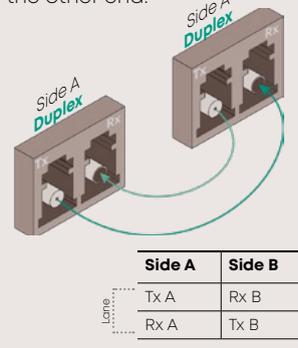

### Technical data

Data rate	10G	25G	
Form factor	SFP+	SFP28	
Distance	300 m	100 m	2 km
Wavelength	850 nm	1310 nm	
Fiber type	Multimode (OM4)	Singlemode (OS2)	
Temperature range	0...+70°C		
Power budget	6 dB	7 dB	5.6 dB
Modulation and FEC	NRZ		
Physical interface	LC PC duplex		LC UPC duplex
Order information, Cisco coding	CSM-900A06DC-85	CSM-400A07DC-85	CSS-420A06DC-13

### Parallel transceiver's lane assignment

Structured cabling scenarios must assure that Tx and Rx of transceivers on one end are connected to the Tx and Rx on the other end.

# Fiber optic cables

Optipack cables are specially designed for data center structured cabling applications. They are small, flexible, but fire and crush resistant. They are convenient for fusion splice. IANOS splicing modules allow easy termination of cables with no extra fixing accessories. Cables allow easy stripping and outer jacket removal for in-rack cabling.

The white space portfolio includes two cable types: double jacket trunk cable (12 or 24 fiber) that are used together with single or double IANOS modules to build 6- or 12- port duplex links between cabinets. A 48 fiber cable can be used with both single and double modules to deploy 24 duplex port links.

## Applications

- Duplex to duplex permanent links, with splicing modules – splice-and-go

## Features

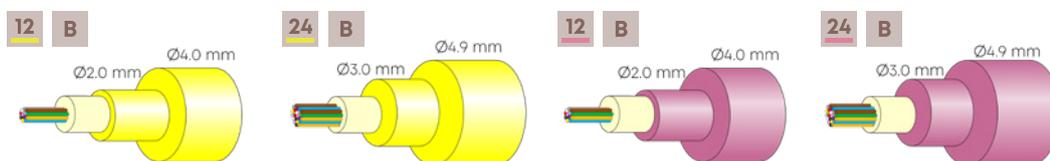

- Metal-free indoor cable, strain relieved with aramid yarns
- Tight bending radii
- Tested, verified and compliant to standards
- Optimised outer-diameter construction
- Cut at place, no cable slack issues
- Compliant to CPR

## Optical characteristics of fiber

### Technical data

Type of fiber	E9/125A2, ITU G.657.A2				G50/125-OM4, ITU G.651 Bend-optimized			
At wavelength	1310 nm		1550 nm		850 nm		1300 nm	
Attenuation in cable, optical loss	Typical	Maximum	Typical	Maximum	Typical	Maximum	Typical	Maximum
	0.35 dB	0.40 dB	0.21 dB	0.25 dB	2.3 dB	2.7 dB	0.5 dB	1.0 dB

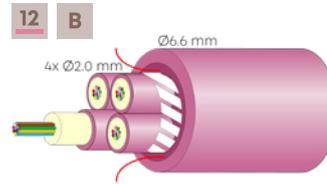

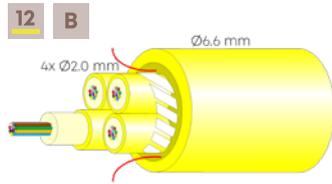

## Optipack double jacket trunk cable, 12 and 24 fiber

Ordering information	<b>85089314</b> 48-12E9A2/(ZN)SNH-E20#B	<b>85092256</b> 48-12G50/(ZN)SNH-L20-G#B

### Splicing G.652.D and G.657.A2

Splicing fiber G.652.D to G.657.A2 is a typical routine. To perform it, make sure that:

1. Fusion splicer is set to full-auto-mode
2. Perform bi-directional OTDR testing (if OTDR testing method used)

### Fiber colours

Cables contain coloured fibers which can be used in any splice scenarios – TIA or DIN

# MTP Pro jumpers

MTP Pro jumpers are 12 fiber Optipack double jacketed cables terminated with MTP Pro male connectors on both sides. MTP Pro jumpers are used to connect MTP to LC transition modules, patch modules or can be used to directly connect equipment in distanced racks.

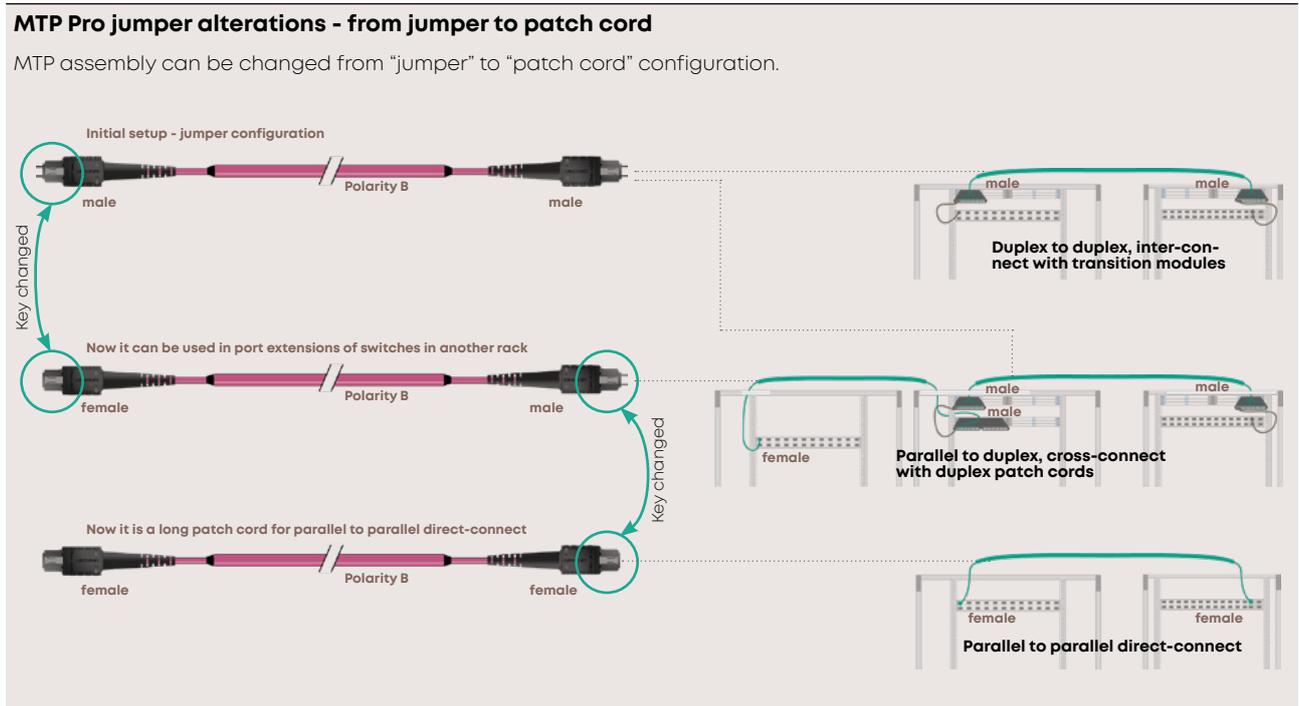

The MTP Pro connector allows for gender and polarity change which is used in structured cabling scenarios. For example, jumper (male to male) can be turned into patch cord (female to female).

## Applications

- Duplex to duplex permanent links, with transition modules - plug-and-go
- Parallel to duplex permanent links

## Features

- Polarity and gender alteration (polarity change only on multimode)
- Optimised outer-diameter construction for outside rack cabling
- Compliant to CPR B2ca
- Base-8 or Base-12e compatible

## MTP Pro jumpers

### Technical data

Fiber type	E9/125A2, ITU G.657.A2	G50/125-OM4, ITU G.651 Bend-optimized
Cable type	Optipack double jacket trunk cable, 12 fiber, 4 mm outer and 2 mm inner diameter	
CPR	B2ca-s1a,d0,a1	
Polarity	B	B (convertible to A)
Connector side A	MTP Pro male (convertible to female)	
Connector side B	MTP Pro male (convertible to female)	
Optical loss, per connector	0.1 dB / 0.35 dB (mean / max)	
Return loss, per connector	Min. 60 dB (for each fiber, both connectors included)	Min. 30 dB (for each fiber, both connectors included)

# Duplex assemblies

Duplex assemblies, also called duplex patch cords, are 2-fiber cables terminated with LC duplex connectors on both sides. In the last five years LC has become the most popular connector in the world, especially in the white space.

The LC-XD connector is a HUBER+SUHNER patented connector that sets new standards for packing density and handling. It allows for adding and removing patch cords in a dense environment.

## Applications

- Duplex to duplex direct-connect
- Duplex to duplex in-rack, inter-connect or cross-connect
- Duplex to duplex permanent link, with patch modules - patch-and-go
- Duplex to duplex port extension

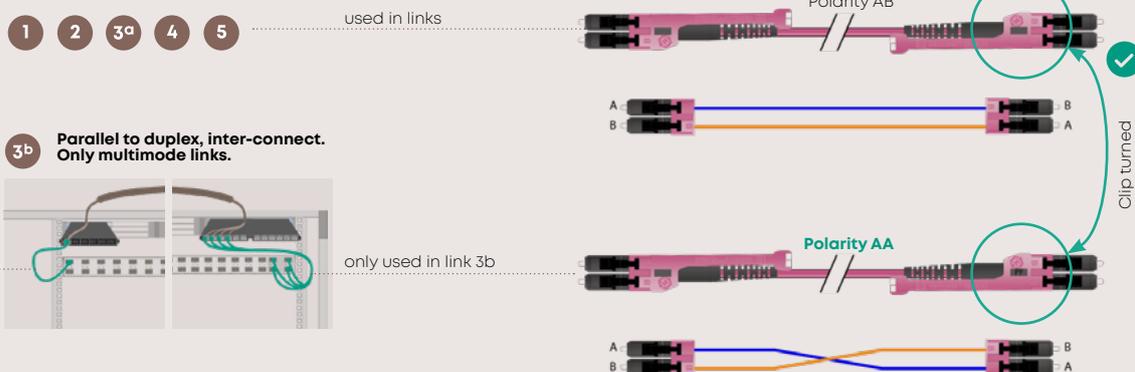

## Features

- Polarity flipping without tool
- Reduced cable diameters
- Push-pull mechanism, pulling antigrip tab
- Labelling possibility

### Duplex assembly alteration

#### Changing the polarity – for in-rack connections

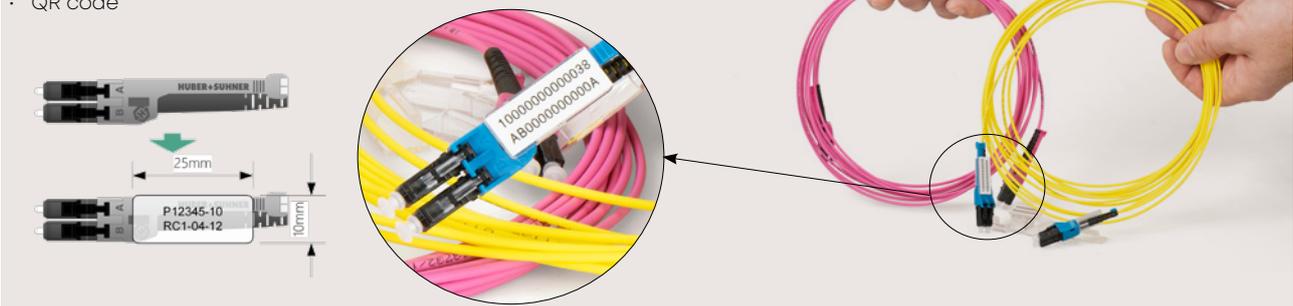

The polarity of a patch cord can be changed from default AB to AA. To do that, one LC-XD connector at one end needs to be changed.

### LC-XD labelling clip

Use the LC-XD clip to place a sticker which can contain:

- the service ID of the patch cord, so that it can be found in the database
- the far end identification
- QR code

# MTP Pro patch cords

MTP Pro patch cords are 12 fiber Optipack single jacketed cables terminated with MTP Pro female connectors on both sides. MTP Pro patch cords are supposed to be used inside racks and cabinets.

The MTP Pro connector allow for gender and polarity change which is used in some structured cabling scenarios. For example, the gender can be changed on one side to allow for a port extension application.

## Applications

- Parallel to parallel direct-connect
- Parallel to parallel or parallel to duplex in-rack, inter-connect or cross-connect
- MPO adapter to MPO adapter cross-connect
- Parallel to duplex port extension
- Parallel to parallel port extension

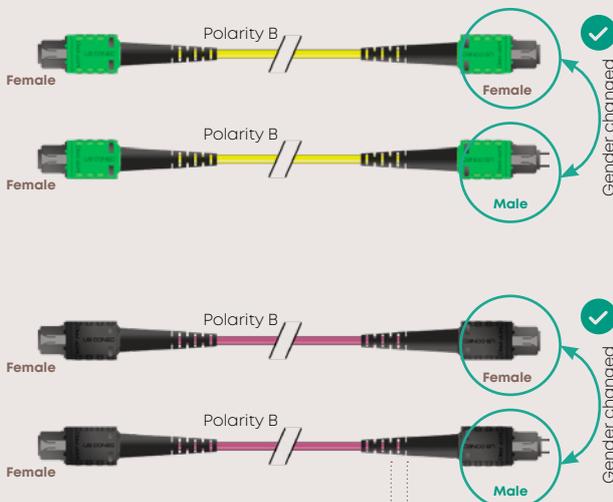

## Features

- Polarity and gender alteration
- Reduced cable diameters for in-rack cabling
- Base-8 or Base-12e compatible

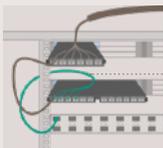

### MTP Pro patch cord alterations

#### Changing the gender - for port extension links

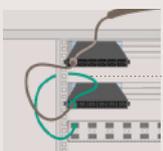

With MTP Pro the gender of a connector can be changed from female to male and back.

4 Parallel to duplex port extension

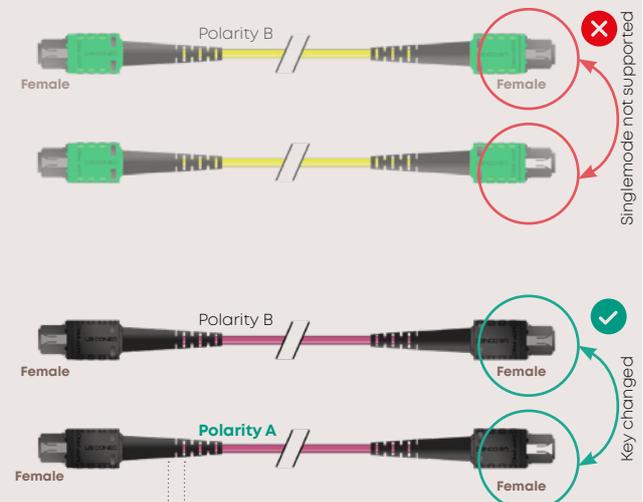

5 7 Parallel to parallel port extension

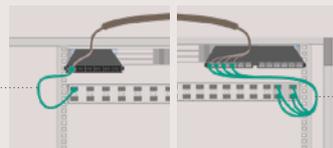

is used in following link designs

#### Changing the polarity - for in-rack connections

With MTP Pro the polarity of an assembly can be changed from B to A and back, by changing the connector at one end. Only multimode is supported.

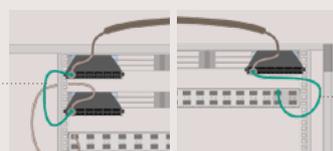

3a Parallel to duplex, inter-connect. Only multimode links.

Duplex patch cord Polarity AB

7 Parallel to parallel, MTP cross-connect. Only multimode

MTP Pro patch cord Polarity B

is used in following link designs

## MTP Pro patch cords

# Harness cables

Harness cables are in-rack single jacketed cables with a MTP Pro connector at one end and four duplex connectors on the other end. They are supposed to directly connect one parallel transceiver to four duplex transceivers (so called breakout mode) located in the same rack.

Harness cables can also be used in other structured cabling scenarios. These scenarios are not shown in the brochure to maintain simplicity.

## Applications

- Parallel to duplex direct-connect

## Features

- Polarity flipping without tool
- Reduced cable diameters
- Push-pull mechanism, pulling antigrip tab
- Labelling possibility

## Optipack harness, 8 fiber

### Technical data

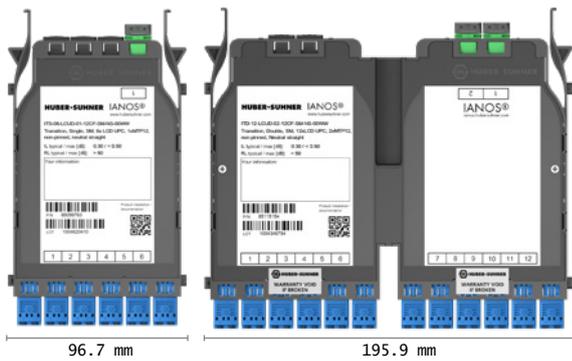

Fiber type	E9/125A2, ITU G.657.A2	G50/125-OM4, ITU G.651 Bend-optimized																									
Cable type	Optipack cable, 8 fiber, ø2mm																										
CPR	Dca-s1a,d0,a1																										
Breakout application examples	<ul style="list-style-type: none"> <li>• 40G SR4 to 4x 10G SR</li> <li>• 100G SR4 to 4x 25G SR</li> </ul>	<ul style="list-style-type: none"> <li>• 100G PSM4 to 4x 25G LR</li> <li>• 400G DR4 to 4x 100G DR</li> </ul>																									
Polarity	NP (convertible to NS by altering polarity on LC)	NP (convertible to NS by altering polarity on MTP)																									
Connector side A	MTP Pro female (convertible to male if required)																										
Connector side B	4x LC-XD UPC duplex	4x LC-XD duplex																									
Insertion loss, per assembly	0.30 dB / 0.65 dB (mean / max)																										
Return loss, per assembly	Min. 60 dB

# MTP Pro tools

Due to the possibility to reconfigure the MTP Pro connector, many different cabling scenarios are possible with the same MTP jumper or patch cord.

## Features

- With the field tool you can remove or add pins to the connector allowing to change female to male and back
- You can change the key of multimode MTP Pro connector so that polarity of assembly can be changed from A to B and vice versa
- Pin exchangers required to remove (female version) or add pins (male version) to the MTP connector

# Cleaning tools

Always inspect a connector before any mating. If a connector is not clean, first try the dry cleaning method with the listed cleaning tools below. In most cases that is sufficient. However, sometimes wet cleaning is required. Please ask your partner for wet cleaning solutions.

## Features

- Universal push style cleaner for both adapter (behind the wall connector) and plug
- More than 525 cleans per one device

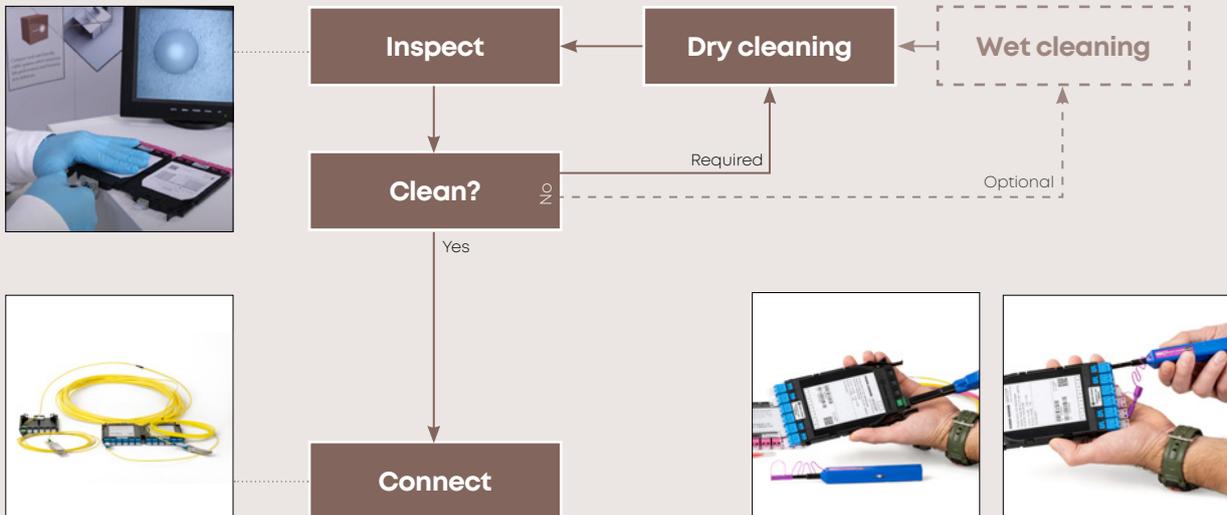

## IBC™ push cleaners

### Technical data

Connector type	LC	MTP

## About HUBER+SUHNER

We are a leading global supplier of components and systems solutions. With our broad range of products and deep know-how, we serve the industry, communications and transportation markets with applications from the three technologies of radio frequency, fiber optics and low frequency. And as a global company with a presence in over 80 countries, we stay close

HUBER+SUHNER AG  
Degersheimerstrasse 14  
9100 Herisau  
Switzerland  
Phone +41 71 353 41 11
