# EDITORS

Bitcoin pushed back above the \$68K level, but the move lacked conviction as bulls struggled to hold price at higher levels. Every attempt to build momentum is getting sold into, and the tape is starting to show clear distribution. With March coming to a close, bears are eyeing a weak monthly finish, which could lock in six straight red months — something we haven't seen since the 2018 bear market. That kind of structure keeps traders cautious, with many now treating upside moves as short-term relief rallies rather than the start of a sustained trend reversal.

On-chain signals are not offering much comfort either. Willy Woo flagged that Bitcoin could still be in a broader correction phase, with potential downside targets sitting between \$46K and \$54K based on multiple models. The key takeaway here is simple — the deeper the drawdown from the highs, the longer the recovery cycle. Data from Econometrics suggests that if BTC manages to defend the \$60K region, a full recovery could take roughly 300 days from the \$126K peak seen in October 2025. We're already about halfway through that timeline, but if price breaks lower into the \$40K-\$45K range, that recovery window could stretch deep into 2027. In trading terms, this is a market where patience matters more than chasing volatility.

# LETTER

Bitcoin saw a fake breakdown this week as price closed below the ascending triangle support on Sunday, but the bears failed to follow through. That lack of continuation on the downside gave bulls a window to step back in, and we've now seen BTC reclaim that broken support level. This kind of move often signals a classic bear trap, where weak hands get shaken out before a reversal. Right now, price is pushing into the moving averages, which is acting as a key dynamic resistance zone. If bulls manage to flip this level into support, momentum could build quickly and open a move toward the \$74,500 to \$76,000 liquidity zone. However, if sellers defend this region aggressively and push price back below \$65,000, then the structure weakens again and we could see a clean move down into the \$62,500 to \$60,000 demand area.

Ethereum also showed resilience after dipping below the 50-day moving average near \$2,040. Bears tried to extend the move lower but failed to break the \$1,916 support, which is clearly acting as a strong demand zone for now. Bulls are attempting to reclaim the moving averages, and if they manage to do so, it puts ETH back into a bullish recovery structure. A successful reclaim could drive price toward \$2,400, where sellers are likely to step in again. If that level breaks with strength, then the next upside target sits around \$2,600. On the flip side, if ETH gets rejected at the moving averages and rolls over, a break below \$1,916 would shift momentum back to the bears and expose the \$1,750 level as the next downside target.

BNB continues to trade in a tight range with no strong directional conviction yet. Price has been sitting below the moving averages, but bears have not been able to force a breakdown toward the \$570 support. That signals a lack of aggressive selling at current levels. Bulls are trying to reclaim the moving averages, but this zone remains a key hurdle. If price gets rejected here, we could see another rotation back toward the \$570 support. However, a clean break and close above the moving averages would likely keep BNB stuck in a consolidation range between \$570 and \$687 for a while longer. A breakout above \$687 would be the real signal of strength and would shift control firmly back to buyers.

XRP is still showing relative weakness compared to the rest of the market. Price remains below the moving averages, and the structure continues to trend slightly downward. Momentum indicators are also leaning bearish, suggesting that sellers still have control in the short term. The \$1.27 level is acting as key support, and bulls need to defend this zone to avoid further downside. If that level breaks, XRP could quickly slide toward \$1.11. However, if buyers step in aggressively and push price back above the moving averages, it would signal absorption at lower levels and could trigger a recovery move toward \$1.61.

## Trader's Outlook

In the near term, BTC is at a critical inflection point, and the reclaim of the triangle support is a strong signal, but confirmation depends on how price behaves around the moving averages. If BTC flips this zone, momentum traders will likely step in targeting the \$75K-\$76K region, but failure here could lead to another liquidity sweep below \$65K. ETH is setting up for a potential trend continuation if it reclaims the moving averages, and traders will be watching for a breakout structure toward \$2,400 as the first confirmation. BNB remains range-bound, so the best approach here is to trade the extremes until a clear breakout above \$687 or breakdown below \$570 occurs. XRP is still the weakest of the four, and unless it reclaims the moving averages, rallies may continue to be sold into. From a broader market perspective, this looks like a consolidation phase with multiple fakeouts on both sides, which is typical before a larger directional move. Traders should remain cautious and avoid over-leveraging, especially with price sitting around key technical levels across majors. Liquidity is building on both sides of the range, and whichever side gets taken out with volume will likely dictate the next trend. Watching BTC dominance and overall market sentiment will be key in confirming direction. Altcoins may continue to lag unless BTC shows a clean breakout and holds higher levels. In the short term, patience and confirmation-based entries will outperform aggressive guessing in this kind of environment.

Lastly please check out the advancement's happening in the cryptocurrency world

Enjoy the issue!

# CRYPTONAIRE WEEKLY

Cryptonaire Weekly is one of the industry's longest-running and most trusted sources for cryptocurrency news, market insights, and blockchain analysis. Created to support our Platinum Crypto Academy clients and global subscribers, the magazine delivers clear research, actionable technical analysis, and strong thought leadership across the digital asset space.

Each week, we provide readers with in-depth articles, project updates, and market commentary that cover the rapidly evolving world of blockchain and Web3. For traders, investors, developers, and entrepreneurs, navigating this fast-changing environment can be challenging. Our mission is to simplify that journey and help readers make informed, confident decisions.

Since our launch in 2017, we've covered every major cycle in crypto from Bitcoin's early rally past **\$20,000 in 2017** to its sharp correction near **\$3,200 in 2018**, marking one of the strongest bear markets in the sector's history. We followed Bitcoin's surge to **\$69,000 in 2021** and its deep pullback to around **\$16,000 in 2022** during a period of global uncertainty and high-profile exchange failures. Most recently, we've tracked Bitcoin's powerful 2025 resurgence as it broke into six-figure territory, hitting levels above **\$123,000** and reaffirming long-term market confidence.

Our **Platinum Crypto Academy** community includes thousands of students and traders worldwide. Over time, **Cryptonaire Weekly** has grown to more than **250,000 active subscribers** and a **social reach of over 1.2 million followers across multiple platforms and community groups**. Through our research-driven insights and strategic relationships, we've also helped **350+ blockchain and crypto projects gain** meaningful traction and visibility in the global market.

For anyone looking to stay informed, identify opportunities, and understand the technologies shaping the future of finance, Cryptonaire Weekly remains a trusted and valuable resource.

# WEEKLY CRYPTOCURRENCY MARKET ANALYSIS

Hello, welcome to this week's 420th edition of Cryptonaire Weekly Magazine. The global crypto market cap is \$2.33 trillion, Down \$80 billion since last week. The total crypto market trading volume over the last 24 hours is \$85.35 billion, which makes a 27.13% increase in the last 24 hours. The Fear & Greed index is 28% Fear and the Altcoin season index is 48% which makes a 1% decrease since last week.

Bitcoin's price has decreased by 4.03% from \$70,280 last week to around \$67,450 and Ether's price has decreased by 3.75% from \$2,135 last week to \$2,055 Bitcoin's market cap is \$1.35 Trillion and the altcoin market cap is \$980 Billion. Bitcoin pushed back above the \$68K level, but the move lacked conviction as bulls struggled to hold price at higher levels. Every attempt to build momentum is getting sold into, and the tape

is starting to show clear distribution. With March coming to a close, bears are eyeing a weak monthly finish, which could lock in six straight red months — something we haven't seen since the 2018 bear market. That kind of structure keeps traders cautious, with many now treating upside moves as short-term relief rallies rather than the start of a sustained trend reversal.

On-chain signals are not offering much comfort either. Willy Woo flagged that Bitcoin could still be in a broader correction phase, with potential downside targets sitting between \$46K and \$54K based on multiple models. The key takeaway here is simple — the deeper the drawdown from the highs, the longer the recovery cycle. Data from Econometrics suggests that if BTC manages to defend the \$60K region, a full recovery could take roughly 300 days from the \$126K peak seen in October 2025. We're already about halfway through that timeline, but if price breaks lower into the \$40K-\$45K range, that recovery window could stretch deep into 2027. In trading terms, this is a market where patience matters more than chasing volatility.

On the adoption side, there's a constructive development worth noting. Block, Inc. is rolling out Bitcoin payments through its Square point-of-sale systems for eligible US merchants. The move, highlighted by Bitcoin advocate Jack Dorsey and product lead Miles Suter, is designed to remove friction around volatility and custody — two of the biggest barriers for merchants. From a market perspective, this doesn't immediately move price, but it strengthens the long-term fundamental narrative around Bitcoin as a payment layer. Block currently holds 8,883 BTC on its balance sheet, reinforcing its continued commitment to the asset.

Flows, however, are telling a different story in the short term. According to CoinShares, crypto investment products saw \$414 million in outflows last week — the first negative week in over a month. This shift reflects a clear risk-off tone as macro pressure builds. Rising inflation concerns, escalating tensions in the

Middle East, and a hawkish shift in expectations around the Federal Open Market Committee are all weighing on sentiment. Total assets under management have slipped back to \$129 billion, effectively resetting the market to levels seen earlier in the year. For traders, this is classic macro-driven flow — when liquidity tightens, crypto feels it fast.

Meanwhile, the volatility narrative continues to extend beyond traditional markets. A trader on Polymarket turned a small \$676 position into over \$67K during a UFC fight due to a brief mispricing event. The trade came after a mistaken winner announcement during a bout between Tyrell Fortune and Marcin Tybura, which temporarily distorted odds. While this is not directly crypto-related, it perfectly highlights how fast-moving markets — especially prediction and derivatives platforms — can create outsized opportunities for those reacting in real time. It's a reminder that inefficiencies still exist, but execution speed is everything.

On the ETH side, accumulation is picking up despite the broader uncertainty. Bitmine Immersion Technologies has been aggressively adding to its Ether position, purchasing over 71,000 ETH in the past week alone and extending a five-week buying streak. The firm is positioning for a recovery phase, suggesting that ETH may be nearing the end of what they describe as a "mini crypto winter." This kind of steady accumulation, especially at scale, often signals long-term conviction — even if short-term price action remains choppy. At the same time, institutional flows into crypto products have slowed, reinforcing the idea that smart money is being selective rather than broadly risk-on.

There's also an interesting macro correlation developing. According to Bitmine's leadership, crypto and equities are increasingly moving inversely to oil prices. As long as oil remains elevated, it acts as a headwind for risk assets, including Bitcoin and Ether. In simple terms, energy-driven inflation keeps pressure on central banks, which in turn limits liquidity — and liquidity is what fuels crypto rallies.

## Market Outlook

Right now, the crypto market is stuck in a classic tug-of-war between weak technical structure and improving long-term fundamentals. Bitcoin holding above \$60K remains the key level to watch, as a breakdown below that could accelerate downside momentum quickly. At the same time, any sustained reclaim of the \$70K zone would likely shift short-term sentiment back in favor of the bulls. Macro remains the dominant driver, with inflation data, interest rate expectations, and geopolitical tensions all feeding into market direction. Liquidity conditions are still tight, which is why rallies are getting sold into rather than extended. Ethereum is showing early signs of accumulation, which could position it well once sentiment turns. Institutional participation has cooled, but not disappeared, suggesting a phase of consolidation rather than exit. Traders should expect continued volatility with sharp moves on both sides, especially around key macro events. The correlation with oil is becoming increasingly important, making energy markets a key external signal to watch. Overall, this is a market best approached with a tactical mindset — focusing on key levels, staying patient, and avoiding overexposure. The bigger trend is still intact, but the path forward looks choppy before any sustained upside move.

## Percentage of Total Market Capitalization (Domnance)

BTC	58.04%
ETH	10.68%
USDT	7.92%
BNB	3.59%
SOL	2.05%
Others	17.72%

## 2. HOW DOES ITS ECOSYSTEM & BLOCKCHAIN WORK?

### 1 Infrastructure on Ethereum & Ethereum Classic:

### 3 Multi-Token Ecosystem

### 4 Transparency and Audits

### 5 Transparency and Audits

### 2 Transparency and Audits

**UK Financial Ltd** has confirmed the live deployment of LTNS1 on MYEX Exchange, Long-Term Note Series 1, its fully owned corporate digital asset. Built on the ERC-3643 security token standard, LTNS1 moves a fixed-income debt structure entirely on-chain. It bridges conventional financial commitments with a transparent, blockchain-based smart contract framework.

The deployment covers a complete compliance architecture across 11 smart contracts. This includes one main token contract, five identity and compliance registry contracts, and five on-chain asset proof contracts. The system separates token logic, identity verification, compliance enforcement, and registry management into distinct contracts. Before any transaction is approved, the system checks whether both the sender and receiver meet pre-set conditions, such as jurisdiction or investor status. Together, these represent a \$1.1 trillion maturity value, all publicly verifiable on Ethereum.

Publicly accessible systems combining compliance-controlled token behavior, identity-gated ownership, and document-linked asset proof remain rare in transparent implementation. LTNS1 addresses this gap with a fully modular, on-chain structure at a declared scale that few comparable deployments have demonstrated publicly.

Token transfers have not yet begun broadly. UK

Financial Ltd confirmed this reflects active compliance requirements, including circulation verification, data alignment with tracking systems to ensure tokens are fully live and traceable. Transfers are expected to begin as early as next week. Previously purchased assets will be honored, and additional distribution programs are under development.

The company has intentionally kept public communication limited. UK Financial Ltd is currently building a next-generation ecosystem combining blockchain verification with digital asset exchange, designed for regulated digital assets. Further details will be released upon completion.

The asset tokenization market was valued at \$2.08 trillion in 2025 and is estimated to grow to \$18.74 trillion by 2031. Major institutions such as BlackRock, Franklin Templeton, and JPMorgan have already launched tokenized funds, signaling growing momentum. UK Financial Ltd's approach positions LTNS1 within this shift, prioritizing verifiability and regulatory alignment over speed of issuance.

Platinum Crypto Academy views LTNS1 as a structurally meaningful deployment in compliant tokenized finance. The layered use of ERC-3643, with separate contracts governing identity, compliance, and asset proof, demonstrates a disciplined architecture that aligns with how institutional-grade digital assets are being built globally in 2026.

# ADVANCEMENTS IN THE CRYPTOCURRENCY WORLD

## BTC USD PRICE FALLS BELOW \$67K: 10-YEAR US TREASURY YIELD APPROACHES YEARLY HIGH

BTC USD has broken below the \$67,000 price level for the first time since March 9, sliding by 5 big percents in 24 hours to trade at \$66,300, and the macro backdrop just got considerably uglier. The 10-year U.S. Treasury yield is closing in on 4.5%, its highest level since July, draining risk appetite across crypto markets. Whether this dip finds a floor or accelerates into deeper liquidation territory is the question every trader is asking right now.

The selloff triggered close to \$50 million in long liquidations in a single hour, with Coinglass data showing roughly 90% of those wipes coming from long positions. Shares of crypto-adjacent equities like Circle Internet (CRCL), Coinbase (COIN), and Strategy (MSTR) all fell in pre-market trading. Funding rates have flipped negative, meaning short traders are now paying longs: a textbook bearish signal in perpetual futures markets.

BTC USD has broken below the \$67,000 price level for the first time since March 9, sliding by 5 big percents in 24 hours to trade at \$66,300. source, CoinGlass

Macro conditions are compounding the pressure. The MOVE Index, which tracks U.S. bond market volatility, surged 18% in 24 hours. Oil prices, both Brent and WTI, rose 3% as Ukraine's disruption of Russian oil flows complicated Trump's supply-stabilization plans.

Risk assets are caught in a crossfire of rising yields, geopolitical friction, and forced crypto deleveraging. The broader BTC price outlook was already fragile heading into this week.

The BTC USD price technical structure has deteriorated sharply. Key support levels sit at \$68,400 has broken in a flash. All short-term moving averages are flashing SELL; the MA5 sits at \$74,900, the MA3 at \$78,900, both far above spot, confirming sustained downward momentum rather than a shallow correction.

The 48-hour liquidation heatmap is particularly concerning: a dense liquidity cluster sits below \$66,000, which functions as a magnet for price during high-volatility episodes.

## Bitcoin Spot ETFs Break 4-Week Positive Streak With \$296M Outflow

Bitcoin price struggles over the last week were also in its ETF market, as the Bitcoin spot ETFs posted their first net outflows in a month. Before this trading session, these investment funds had experienced a 4-week bullish streak, resulting in a combined net inflow of \$2.21 billion.

Bitcoin ETFs See Red Again, While Potential New Member Awaits  
According to data from SoSoValue, the combined trading activity across the 12 Bitcoin Spot ETFs resulted in a negative inflow of \$296.18 million over the past week. This development represents the seventh weekly

outflow of 2026, and the fifteenth since the crypto bear market commenced in October 2025. A daily analysis shows the net withdrawal performance is highly linked to consecutive outflows on Thursday and Friday, combinedly valued at over \$396 million. For context, the \$225.48 million outflow registered on Friday represents the market's largest net outflow since March 3rd.

Looking at individual fund performance, BlackRock IBIT experienced the largest net redemptions valued at \$158.07 million.

## Bitcoin drops as Rubio privately signals Iran war may last weeks, locking in high oil prices

Rubio reportedly told G7 ministers privately that the war with Iran could continue another 2-4 weeks, a timeline that threatens to keep oil elevated and risk assets under pressure.

Marco Rubio sat down with G7 foreign ministers and told them privately that the war with Iran could continue another two to four weeks, handing Washington's closest allies and the market a countdown.

Reports noted that Rubio publicly said the operation should conclude in "weeks, not months," and the gap between those two framings captures the window long enough to sustain macro strain where Bitcoin now trades.

Bitcoin reached an intraday low of \$65,571.07 on Mar. 27, down roughly 4.4% on the day. Meanwhile, Brent crude was at \$111.52, up 53% since the war began on Feb. 27.

The Nasdaq had entered correction territory, the 10-year Treasury yield stood at 4.44%, and Fed futures

reflected essentially zero probability of a rate cut this year. That combination explains Bitcoin's session losses with precision.

Oil above \$100 pushes freight costs into every supply chain simultaneously.

EIA data shows tanker rates for VLCCs from the Middle East to Asia hit their highest level since at least November 2005 in March. Stickier inflation expectations follow, as University of Michigan consumer sentiment fell to 53.3, and one-year inflation expectations jumped from 3.4% to 3.8%.

## Strategy, BitMine and Robinhood Shares Hit Monthly Lows as Bitcoin Sinks Further

**B**itcoin fell to its lowest price since March 2 on Friday as major crypto-related stocks like Strategy and BitMine suffered tougher losses.

Major crypto-related stocks fell sharply Friday, with some hitting their lowest prices in at least a month as markets reacted to continued uncertainty around the Iran war, and Bitcoin fell to its lowest price since March 2.

Bitcoin was recently trading at \$65,804, down more than 4% on the day. It fell as low as \$65,720 earlier Friday, which is the lowest price registered since March 2, the first business day after the United States and Israel began bombing Iran, as markets reacted to the surprise weekend assault.

Other major cryptocurrencies are similarly feeling the pain, with Ethereum down about 4% to \$1,980, Solana falling 5% to under \$83, and BNB dipping 3% to \$608. Over \$500 million worth of crypto positions have been liquidated in the last 24 hours, per data from CoinGlass, with nearly 90% of the carnage coming from long positions.

Strategy, the largest corporate holder of Bitcoin with approximately \$50 billion in holdings, saw its stock (MSTR) fall more than 5% on the day as of this writing, recently trading below \$126. It fell below \$124 earlier Friday, marking its lowest price in more than a month.

## BNP Paribas adds six Bitcoin, Ether ETNs for retail clients in France

**C**rypto ETN adoption is spreading across Europe as banks expand offerings and the UK reopens retail access after lifting its ban.

French multinational universal bank BNP

Paribas is expanding its investment offering to include six crypto-linked exchange-traded notes (ETNs), giving retail clients in France access to Bitcoin and Ether exposure through regulated products.

The new ETNs, indexed

to the price of Bitcoin BTC \$67,851 and Ether ETH \$2,071, will be available from Monday via standard securities accounts, according to the company. The products are open to individual investors, entrepreneurs, private banking clients and users of the bank's digital platform, Hello bank!. The rollout may later extend to wealth management clients outside France.

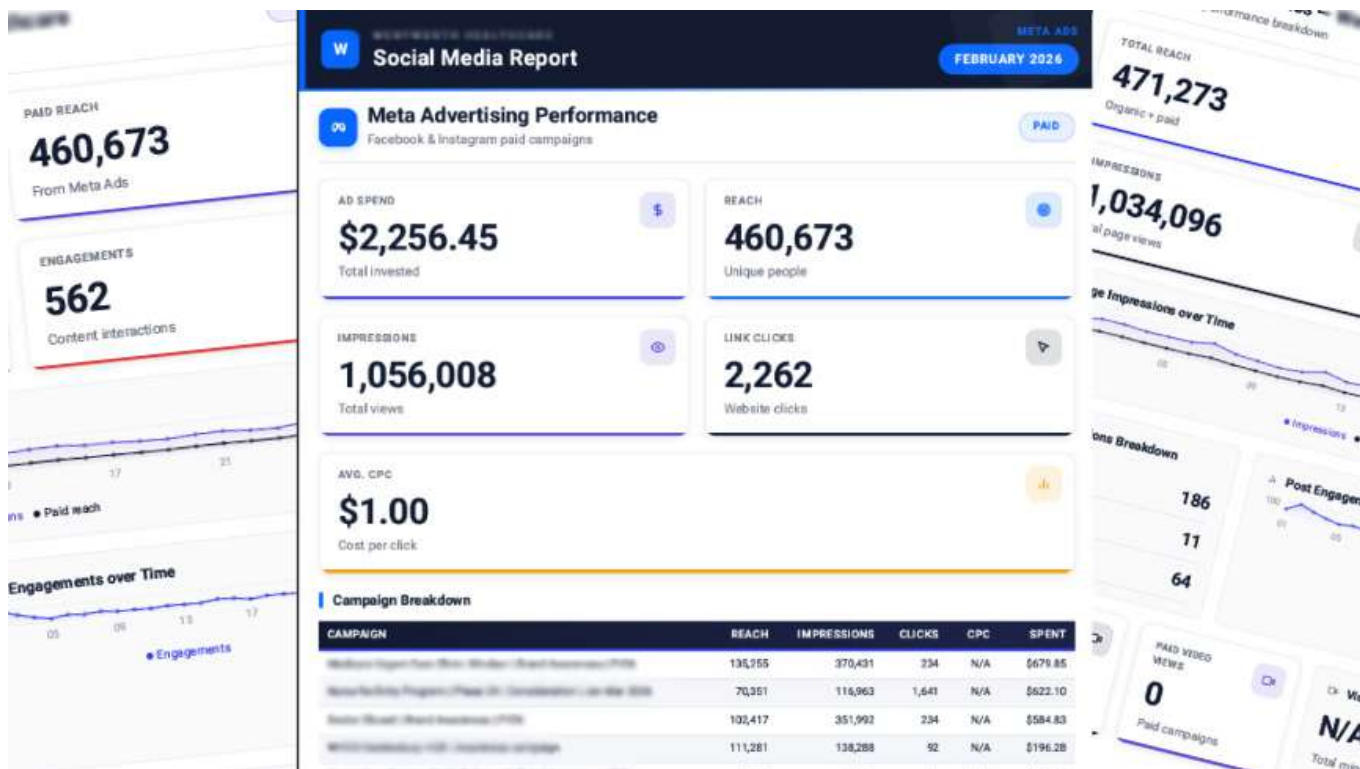

Unlike direct crypto purchases, ETNs allow investors to track the performance of digital assets without holding them. ETNs have credit risk (if the bank fails, you lose money), no tracking error and tax advantages.

The move builds on the French bank's broader digital asset efforts. In 2024, BNP Paribas arranged and placed Slovenia's first digital sovereign bond, marking the European Union's debut issuance of a blockchain-based government bond.

In September last year, BNP Paribas and HSBC joined the Canton Foundation, which governs the Canton Network, a blockchain focused on institutional finance and real-world asset tokenization.

Prior to this, BNP Paribas joined Goldman Sachs, Citadel and other major financial players.

KnowYourMarket.ai has hit a major product milestone, with the platform's first reporting template now live.

This marks a significant step forward in bringing the KYMAi vision to life - transforming complex marketing data into clear, actionable strategic direction.

### A step forward in meaningful analytics

The reporting template is designed to do what traditional dashboards fail to deliver: not just present data, but interpret it. By combining audience intelligence, performance signals and strategic frameworks, the output is a report that helps businesses understand exactly where to focus and why.

### Clean and Structured

Early previews of the template highlight a clean, structured format that translates data into insight, removing ambiguity and reducing the time required to make confident marketing decisions.

### The beginning of something meaningful

This first template is just the beginning. It lays the foundation for a broader suite of outputs that will continue to evolve as the platform scales.

As development progresses, KnowYourMarket.ai will begin rolling out access to early users, marking the transition from concept to real-world application.

## Canada moves to ban crypto donations for election campaigns following UK

Bill C-25 follows years of warnings from Canada's Chief Electoral Officer about the risk that crypto donations could pose to electoral integrity.

Canada's Bill C-25 would ban cryptocurrency, money order and prepaid card donations across the federal political system, closing a fundraising channel that has seen virtually no use since crypto was first permitted in 2019.

The Chief Electoral Officer, who initially favored tighter regulation, shifted in 2024 to recommending an outright prohibition, citing cryptocurrency's pseudo-anonymity and the fundamental difficulty of verifying contributor identities.

The bill, a reintroduction of the failed Bill C-65, sets 30-day deadlines to return or remit illegal crypto contributions and imposes penalties up to twice the contribution's value plus \$100,000 for corporations, and is currently at first reading in the House of Commons.

Canada's federal government has moved to ban cryptocurrency donations to political campaigns, shutting down a fundraising channel that appears to have seen little to no real-world use in the country's previous elections.

Bill C-25, the Strong and Free Elections Act, introduced March 26, would prohibit political contributions made in BTC and other cryptoassets.

## Lido DAO proposes \$20 million one-off LDO buyback as token hovers near all-time low

Lido's ecosystem operations team has proposed spending up to 10,000 stETH (roughly \$20 million) from the DAO treasury to buy LDO tokens at what it calls a historically depressed valuation.

At current prices, the buyback could absorb around 8% of LDO's circulating supply.

The proposal is separate from Lido's still-pending NEST automated buyback program, which has not activated under present market conditions.

LDO hit a new all-time low of \$0.27 on Mar. 7, and currently trades near \$0.31.

Ethereum's largest liquid staking protocol is looking to deploy a significant chunk of its treasury to buy back its own governance token.

A governance proposal posted Friday by the Lido Ecosystem Operations team seeks authorization for the Lido Growth Committee to spend up to 10,000 stETH from the DAO treasury to accumulate the protocol's native LDO token. At current ether prices of roughly \$2,000, that amounts to approximately \$20 million.

The LDO-to-ETH ratio currently sits at around 0.00016, which the proposal describes as a 70% discount to levels that characterized most of the prior two years. The token recently set a new all-time low near \$0.27 on Mar. 7 and currently trades near \$0.31, per The Block's Lido Price page, with a market capitalization of roughly \$260 million. At current prices, the buyback could absorb roughly 65 million tokens, or about 8% of the circulating supply.

## Why Crypto-Backed Mortgages Matter for Expanding Access to Homeownership

Crypto-backed mortgages gain traction as housing costs strain affordability, positioning digital assets as an alternative pathway to unlock homeownership while reshaping how lenders assess wealth and borrower eligibility.

Housing Affordability Pressures Drive Crypto Mortgage Innovation Growing barriers to homeownership are prompting financial firms to redefine how wealth is evaluated, with Coinbase partnering with Better Home & Finance Holding Company to enable crypto-backed mortgages supported by Fannie Mae that allow borrowers to use bitcoin or USDC instead of cash for down payments.

Access constraints stem from structural shifts in housing affordability and borrower qualification standards. According to the NAHB/Wells Fargo Cost of Housing Index (CHI) released in March 2026, a typical family earning the national median income of \$104,200 needed 34% of their income to cover the total mortgage payment on a median-priced new home in Q4 2025.

For lower-income households earning 50% of the median, these costs reached 67% of their earnings, a level the Department of Housing and Urban Development (HUD) classifies as a severe cost burden.

## Kraken's Tokenized Equities Platform Lists VCXx Offering Exposure to SpaceX, OpenAI, Anthropic and More

Kraken's tokenized equities platform xStocks and Fundrise launch VCXx to provide tokenized onchain exposure to late-stage private tech companies.

Kraken's xStocks and Fundrise announced on March 27, 2026, that they are tokenizing the newly launched Fundrise Innovation Fund (NYSE: VCX) to create a single onchain asset, VCXx, giving eligible investors global access to a portfolio including SpaceX, OpenAI, Anthropic and Databricks. The tokenization will list VCXx on the xStocks platform in the coming days and is issued by Backed Assets (JE) Limited and offered via Payward Digital Solutions Ltd.

The move extends tokenized equities beyond public markets into private-company exposure and enables VCXx to be used for onchain applications such as collateralization, lending, and automated strategies; xStocks reports over \$25 billion in transaction volume and 100,000+ unique holders and supports 100+ tokenized stocks and ETFs. VCX is not available in the U.S. and geo restrictions apply; eligibility and jurisdiction notes follow issuer disclosures and the xStocks risk documentation.

"We built VCX to act as a bridge between the public and private markets," said Ben Miller, CEO of Fundrise.

# Stablecoin payments go 'invisible' in Southeast Asia as crypto card business surges

**S**traitsX, a Singapore-based company, has seen rapid growth in its stablecoin card program, with a 40x surge in transaction volume and an 83x increase in card issuance between 2024 and 2025.

StraitsX, a Singapore-based company, has seen rapid growth in its stablecoin card program, with a 40x surge in transaction volume and an 83x increase in

card issuance between 2024 and 2025. The company's infrastructure powers stablecoin-backed cards for partners like RedotPay, which processed over \$2.95 billion in card volume in 2025, and enables seamless transactions in local currency. StraitsX aims to make its stablecoin layer invisible, with plans to expand its presence in Southeast Asia and beyond, and to enable machine-to-machine micropayments on the

Solana blockchain with its upcoming stablecoins, XSGD and XUSD.

When a tourist from Bangkok taps to pay in Singapore using their Thai e-wallet, few stop to consider what powers that transaction.

But for Singapore-based StraitsX, the company behind the stablecoin infrastructure running

in the background, that seamless experience is exactly the point.

Between the fourth quarter of 2024 and the same period in 2025, StraitsX saw its card transaction volume surge by 40 times, the company's co-founder and CEO Tianwei Liu told CoinDesk.

## MicroStrategy Chair Michael Saylor Breaks 13-Week Bitcoin Buying Ritual

**S**aylor skipped his Sunday "Orange Dot" post for the first time in 13 weeks.

Strategy promoted its STRC preferred stock instead of teasing new BTC purchases.

Monday's 8-K filing will reveal whether the firm actually paused or still bought.

Strategy (MicroStrategy) may have skipped its weekly Bitcoin (BTC) purchase for the first time since late December, potentially ending a 13-week accumulation streak.

Executive Chair Michael Saylor did not post his customary Sunday "Orange Dot" tracker on X (Twitter). He instead pivoted to promoting Stretch (STRC), the company's per-

petual preferred stock. A Monday 8-K filing will confirm whether the firm actually paused or quietly added to its holdings.

What Happened to MicroStrategy's Orange Dots  
For roughly 13 consecutive weeks, Saylor would post a Bitcoin accumulation chart on Sundays with orange markers signaling upcoming purchases.

A detailed 8-K filing would then follow on Monday mornings, with the ritual becoming a reliable signal for traders tracking the firm's weekly buys.

During the streak that began in late December, Strategy acquired approximately 90,831 BTC.

# Congress proposes removal of widely used Bitcoin tax loophole and giving it to regulated stablecoins

The new Digital Asset PARITY Act draft would extend wash-sale rules to digital assets while shielding certain regulated payment stablecoins from routine gain-or-loss recognition.

Congress has introduced the Digital Asset PARITY Act, a bipartisan discussion draft introduced by Reps. Steven Horsford and Max Miller, who would rewrite Section 1091 to cover “specified assets.”

The category explicitly includes actively traded digital assets and their derivatives, and carves out a narrow class of regulated payment stablecoins from routine gain-or-loss recognition.

The draft lands harder on the crackdown side than on the relief side,

and that asymmetry is what gives the proposal its sharpest edge.

For years, crypto traders have exploited a gap that stock investors cannot touch. Under current law, wash-sale rules apply to “stock or securities,” a definition that excludes digital assets.

A trader could sell Bitcoin at a loss, buy back in the next day, and still claim the tax deduction, a maneuver the IRS explicitly bars in equity markets.

The PARITY Act draft closes that gap by rewriting Section 1091 to cover actively traded digital assets, notional principal contracts tied to them, and related derivatives, including options, forward contracts, futures contracts, and short positions.

# Cathie Wood's Ark Invest Dumps Meta, Nvidia and Bitcoin ETF Shares in Major Tech Sell-Off

Cathie Wood's Ark Invest sold big chunks of its positions in American tech stocks and its own Bitcoin ETF as stocks and crypto slide.

Ark Invest parted with nearly \$41 million in META and \$26 million in NVDA shares on Thursday.

Cathie Wood's firm also dumped around \$11 million worth of shares in its Bitcoin ETF.

The sales come amid a sustained market downturn as uncertainty in Iran shakes stocks and crypto.

Ark Invest, the investment firm of notable tech investor Cathie Wood, shed millions of dollars' worth of shares of major tech stocks on Thursday, significantly trimming positions in Nvidia and Meta while

also diminishing its exposure to Bitcoin via its own Bitcoin ETF.

The firm's Thursday activity saw it part with nearly \$41 million worth of Meta (META) and more than \$26 million in Nvidia (NVDA), both of which have fallen further since the opening bell on Friday, dropping 2.98% and 1.55%, respectively.

The prominent tech stocks have fared much worse over the last month, with META dropping more than 17% over that time to change hands around \$531. The bulk of those losses—around 10%—have come in the last week as the social media platform lost a pair of social media addiction lawsuits that said it failed to protect young users.

## DeFi lender Aave launches on OKX's Ethereum L2, X Layer

OKX's X Layer is the 21st blockchain to integrate Aave, which recently surpassed the \$1 trillion mark in cumulative lending volume.

Aave, the largest decentralized lending protocol with \$23.5 billion in total value locked, has launched on X Layer, an Ethereum layer-2 blockchain launched by crypto trading platform OKX.

It marks a milestone for X Layer, a blockchain with just \$25 million in total value locked, which launched in 2024. The integration would allow OKX Wallet and X Layer users to lend, borrow and earn yield without needing to bridge out to another chain.

"This is a very versatile expansion of our DeFi ecosystem and as such should benefit the full

range of customers we have on X Layer," an OKX spokesperson told Cointelegraph.

X Layer launched in May 2024 in a highly crowded Ethereum layer-2 market. Like many of its competitors, X Layer is focused on scalability, offering \$0.0005 transactions on average at one-second block times.

Other notable DeFi platforms integrated on X Layer include Uniswap for decentralized swaps, Chainlink for oracle services and Stargate for cross-chain money transfers.

Aave recently crossed a historic milestone

The launch comes after Aave surpassed \$1 trillion in cumulative lending volume in late February, an industry first.

## Crypto Giant Bitmain Faces Scrutiny As US Senator Flags Trump Family Ties

A federal investigation into Chinese hardware maker Bitmain sits unresolved, its outcome unknown to the public. That uncertainty is now drawing fire from Capitol Hill — and putting US President Donald Trump's family in the middle of it.

Security Probe Stretches Back To Biden White House  
Senator Elizabeth Warren wrote to Commerce Secretary Howard Lutnick Thursday, asking for internal documents and communications tied to Bitmain Technologies, the Beijing-based company that makes a dominant share of the world's bitcoin mining machines.

According to Bloomberg, which first reported the letter, Warren wants to know what the department

has done to address what she called "potential national security concerns" — and whether business ties to the Trump family have shaped any of those decisions.

The federal probe Warren is pressing on is reportedly known as "Operation Red Sunset," though details about the investigation have not been publicly disclosed. Led by the Department of Homeland Security, it examined whether Bitmain's ASIC mining rigs could be remotely manipulated for espionage or used to knock out parts of the US power grid.

The investigation was launched under the Biden administration and carried into the opening months of Trump's current term. Based on Bloomberg's November 2025 reporting, its status remains unresolved.
