TIPS & TRICKS

UNDERSTANDING TIPS

UNDERSTANDING TIP SIZE

To understand what size tip to use, you must first understand what the digits on the tip indicate.

All tips have 3 digits in the size, say 517. The first digit is the fan size or width of the spray, this digit is always doubled and measured in inches. For example, a 517 tip will spray at 10 inches wide, a 417 tip will spray at 8 inches wide, and a 317 tip will spray at 6 inches wide. These calculations for the spray width are based on the gun being held 12" inches from the surface being sprayed.

The second two digits indicate the size of the orifice and are measured in thousandths of an inch. Thus a 517 tip will spray 10 inches wide, through an orifice size of 15 thousandths of an inch and a 513 tip will spray 10 inches wide, through an orifice size of 13 thousandths of an inch.

Tip size & Coating

You will notice that thinner coatings such as stain and lacquer use smaller size tips because the coating is thin and runny. Heavier coatings such as shipyard use require larger size tips because the product is thicker.

You need to match the correct tip size for the coating that you plan to spray, you may find that in some cases you can use a smaller tip than recommended and in other situations a larger tip. It's really about what works best for you and it's ideal if you keep a range of tips sizes on hand.

If you are planning on spraying a coating that you are unfamiliar with, we always suggest purchasing additional tips, one size under and one size over the suggested size. Doing this could be the difference between a day of successful painting or a day wasted with tip blockages and frustration.

It is always best to check with the manufacturer of the coating to determine the correct tip size. Many paint manufacturer's produce product data sheets that will have airless spray specifications.

4 TYPES OF TIPS

STANDARD OR CONTRACTOR AIRLESS SPRAY TIPS

These are the most common airless spray tip used in a wide variety of industries such as new home construction, metal fabrication and roof coatings.

Common coatings sprayed with standard tips are water-based acrylic in low sheen and flat suitable for painting house interiors and exteriors. The most common size used for this application is the famous 517. The 517 has the right amount of flow and the right spray width and a large part of airless sprayers sold will come with a 517 tip on the gun as standard.

Most people will spray using standard airless spray tips, they will produce a good finish and reduce over spray. It is important that you keep in mind that tips do wear, you should consider changing your spray tip after spraying between 500 and 600 liters of material.

1

HEAVY DUTY AIRLESS SPRAY TIPS

Heavy duty airless spray tips are most mistaken for lasting longer, this is simply not the case. The tungsten carbide in heavy duty tips is no different to the carbide used in standard tips.

Heavy duty spray tips are designed specifically for pressure up to 7500psi, standard spray tips are only rated to 5000psi. The difference between heavy duty tips and standard tips is the way that the carbide tip is retained in the tip barrel. Standard tips usually have an insert fitted into the rear of the barrel in front of the carbide, this is pushed in and machined to the same diameter of the barrel. Heavy duty tips have a threaded insert screwed into the rear of the barrel, the screw insert is designed so that when the tip is reversed to clear a blockage the higher pressure does not push the carbide out through the rear and become a projectile.

The entire design of heavy-duty tips is based around safety to ensure that when an applicator clears a blockage, the entire guts of the tip are not shot out from the end of the gun which could seriously hurt a person nearby if it were to hit them.

It is important to ensure that if your airless sprayer produces more than 5000psi of fluid pressure that you use heavy duty tips that are rated to 7500psi.

Heavy duty airless spray tips require a minimum fluid pressure of 2000psi or higher to correctly atomize the paint, but they can be used with fluid pressure up to 7500psi unlike standard airless spray tips which can only be used at 5000psi.

Common materials sprayed with these tips at higher pressures are zinc, 2k epoxy and 2K epoxy high build. Generally, machines with fluid pressures between 4500psi and 7250psi are used for these coatings. You can also use heavy duty tips for general spraying as you would with standard tips, the results will be the same.

3

FINE FINISH OR LOW PRESSURE AIRLESS SPRAY TIPS

Fine finish tips simply have a pre-orifice at the rear of the tip that slows down the paint flow and allows the paint to atomize more softly. The pre-orifice restricts the paint flow going through the tip and producing a lower, finer pressure of fluid leaving the tip which in turn will reduce over spray. The old rule with over spray always applies the lower the pressure the less over spray you will get.

Fine finish tips can spray material at lower pressure, depending on the material being sprayed, you can get down as low as 1200/1300psi while still maintaining a good spray pattern. The only problem with fine finish tips is that they can block more easily and more often than standard tips because of the pre-orifice. It's important to use a finer filter when spraying with fine finish tips.

Generally fine finish tips are better for lacquers, water based gloss, enamel and 2k (high quality finish coats) where a smaller more detailed area is being sprayed.

Again, fine finish tips will wear out at the same rate as all other tips so be sure to replace them regularly to ensure you get the best results when spraying.

2

LINE STRIPE OR LINE MARKING AIRLESS SPRAY TIPS

4

Line stripe or line marking tips are designed to produce a sharper edge when sprayed giving the painted line a crisper finish. Standard airless tips tend to make the painted edges feather so when each coat is overlapped the finish appears more even.

Most wheeled line markers such will use this type of tip where the gun distance from the surface is about 10 inches (25cm). The height selection of the gun will have some adjustment of the sprayed line width but you will need to have a few different size tips on hand for varied line widths.

Many factors will effect the quality of the line produced -

Surface condition, smooth even surface will produce a nicer line than a rough uneven surface. A rough surface will also make the machine bounce more thus causing additional vibration on the gun arm.

Machine vibration, this is a big factor. Some low end wheel line markers that are built to a price and not quality have horrible vibration due to poor design and pumps that are really too small for the job that need to be run flat out in order to keep up with the spray tip. The combination of poor design with a small pump that must race to keep up will cause vibration at the gun. Add a rough surface to the formula and you will get a horrible finish of the sprayed line.

Rubbish in the paint, this is the most important choice - always use high quality clean line marking paint. Particles in the paint can cause the obvious tip blockage when nothing comes through, but what is more annoying is partial blockages where the paint flow is constantly interrupted by small particles of debris which distorts the even paint flow. People often mistake this for the machine or the tip having an issue but it's actually rubbish in the paint that causes problems like "jagged edges" or "waves" in the sprayed line edge.

Line striping tips will wear out at the same rate as all other tips so be sure to replace them regularly to ensure you get the best results when spraying.

AIRLESS FLAT TIPS

PREMIUM STANDARD

The NOVABLAST Industrial Flat Tips have a top-quality best available Tungsten-Carbide liner and are equivalent to the Graco 163-xxx Silverline tip with sizes ranging from 0.007 to 0.099 inch guaranteeing a huge range of available sizes.

AIRLESS REVERSIBLE TIPS

ECOLINE NOVA 4 TIPS

The NOVABLAST Ecoline Tips, our top-quality reversible tips, are our alternative for a.o the Graco FF-LP and L, have a much-reduced overspray and are capable of working at much lower working pressures. Tip size ranges from 0.006 to 0.032 inch. This line presents a.o the equivalent Graco FF-LP and LP, however, the size of the cylinder tip is the same as the Graco RAC-V. We decided to stick to the RAC-V dimensions to keep our system compatible with other brands like Wagner/Titan, Tritech etc. After all the difference of cylinder tip diameter is only 11,4 mm (GRACO) to 11.1 with our NOVABLAST cylinder type size.

The first tip has a standard angle of 20°.

For the second tip you can choose an angle from the table above.

Flow rates at a water pressure of 100 bar.

SAFETY TIP GUARDS

SAFETY TIP GUARD BLACK

ITEM NUMBER	DESCRIPTION	THREAD	MAX. WORK PRESSURE
89559000	STANDARD	7/8"	340 BAR
89560000	STANDARD	11/16"	340 BAR

SAFETY TIP GUARD ORANGE

ITEM NUMBER	DESCRIPTION	THREAD	MAX. WORK PRESSURE
89452000	EASY CLEAN	7/8"	340 BAR
89457000	EASY CLEAN	11/16"	340 BAR

Suitable for NOVA 4 (RAC V equivalent)

Other thread sizes available on request

SAFETY TIP GUARD PURPLE

ITEM NUMBER	DESCRIPTION	THREAD	MAX. WORK PRESSURE
89552000	HIGH PRESSURE, EASY CLEAN	7/8"	517 BAR
89557000	HIGH PRESSURE, EASY CLEAN	11/16"	517 BAR

Suitable for NOVA 5 (GRACO XHD equivalent)

Other thread sizes available on request
