The water circulation between the heater and the hot tub or pool can be done by gravity, in the case that the connecting hoses/pipes must not be longer than 50cm.

If the distance is greater than 50cm, it is recommended to switch a pump between, but this should not exceed a flow rate of 2000 liter/h, or can be regulated by means of a valve/ball valve. A pump with a low operating pressure (<1 bar) is also recommended to minimize the risk of an increase pressure in the heater.
