

Analytical and Retention Index of Pesticide Residues in Foods – Using InertCap Pesticides

This application details the use of an InertCap Pesticides GC-capillary column to determine the retention times and retention indices of pesticide residues in food products. InertCap Pesticides is a micropolar column chemically bonded to 5 % phenyl-95% methyl polysilalane. The reagents used were PL2005 agrochemicals GC/MS Mix I, II, III, IV, V, VI, and VII of Hayashi Pure Chemical Ind., Ltd.. The Model GCMS-QP2010 Plus of SHIMADZU CORPORATION was used for measurement. The first and second pages show the TICC (Total Ion Current Chromatogram of PL2005 pesticide GC/MS Mix I-VII blended components, and the third and ninth pages show the TICC, retention time, and retention index for each group of PL2005 pesticide GC/MS Mix I-VII.

Structural formula of the InertCap Pesticides liquid phase

Conditions

System	: GC - MS
Column	: InertCap Pesticides 0.25 mm I.D. × 30 m, df = 0.20 μm (Cat. No. 1010-15141)
Col. Temp.	: 50 °C(1 min hold) - 25 °C/min-125 °C - 10 °C/min - 280 °C
Carrier Gas	: He 40 cm/sec (constant linear velocity)
Injection	: Splitless 1 min 250 °C
Liner	: Splitless liners (Cat. No. 3001-16329,5 bottles)
Interface Temp.	: 280 °C
Detection	: MS Scan (<i>m/z</i> : 45-450)
Ion source	: 230 °C
Inj. Vol.	: 1 μL
Sample	: PL2005 pesticide GC/MS MixI-VII 2 ppm

The retention index is a relatively representative index of the retention ratio of straight-chain alkanes in the target compounds based on the number of carbon, and is extremely useful information for qualitative analysis.

The retention index can be determined because in isothermal analysis the logarithm of the retention ratio for straight-chain alkanes is linearly related to the number of carbons and the retention ratio is also linear to the number of carbons in thermal rise analysis
In the case of temperature programming...

Because the retention ratio of straight-chain alkanes is linearly related to the carbon number, the retention index is given by the following equation.

$$\text{Retention index } I = 100 \frac{\text{TR} - tR(Z)}{\text{TR}(Z+1) - tR(Z)} + 100 \times Z$$

TR = retention time of the target component
 TR(Z) = retention time of straight-chain alkanes that precede the components of interest
 TR(Z+1) = retention time of straight-chain alkanes emerging after the components of interest
 Z = number of carbons in straight-chain alkanes with a retention time tR(Z)
