# WHO SHOULD CONSIDER ICU-AT-HOME SERVICES?

ICU-at-home services may be suitable for individuals who:

- Have chronic medical conditions requiring monitored care
- Need long-term ventilator or BiPAP support
- Face financial or logistical constraints related to hospital stays
- Have a history of recurrent hospitalisations
- Are in end-stage disease, requiring dignity and comfort
- Recover better in a home environment
- Require prolonged ICU-level care and wish to reduce infection risk
- Are bed-bound and require high-touch, continuous care

Every case is clinically evaluated for safety and suitability.

# WHAT MAKES OUR ICU ECOSYSTEM FULLY EQUIPPED?

## ADVANCED MEDICAL INFRASTRUCTURE

- Best-in-class ventilators, BiPAPs, monitors, DVT pumps, oxygen concentrators / cylinders, suction machines, etc.
- ICU-grade beds, recliners, and air mattresses

## CLINICAL TEAM

- 24x7 ICU-experienced nurse onsite
- Attendant for bedside support
- Regular home visits by Medanta doctors
- Video consultations with treating specialists

## OPERATIONAL ASSURANCE

- Ongoing supervision by nursing leads
- Detailed clinical documentation and journey mapping
- Regular audits to ensure protocol adherence
- 24x7 customer support with escalation pathways

WHY CHOOSE

# MEDANTA ICU-AT-HOME?

- Medanta's trusted care comes to your doorstep
- Protocols developed and reviewed by Medanta doctors
- Quality assurance at every step
- ICU-trained nurses and support staff
- Seamless coordination with treating specialists
- Infrastructure with empathy-recovery with comfort and dignity

## HOW IT WORKS

### Assessment

Hospital and home evaluation for clinical fit

### Installation

Customised ICU delivered and calibrated

### 24x7 Care

Nurse on site doctor visits and video consultations

### Monitoring

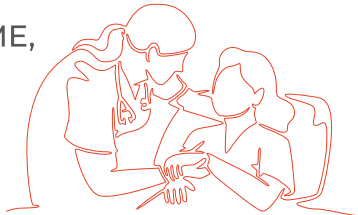

Protocol audits, documentation, escalation matrix

### Transition

Gradual step-down to standard homecare or rehabilitation

COMFORT OF HOME,

# ICU-AT-HOME: A CASE STUDY IN COMPLEX CARE MANAGEMENT

A 63-year-old woman was discharged from the hospital after a serious brain haemorrhage. Her condition was complex — she had undergone a decompressive craniotomy, had a tracheostomy in place, was recovering from sepsis, managing Myasthenia Gravis, and also had a fractured ankle.

At the time of discharge, she was drowsy, fully bed-bound, and on intermittent ventilator support. Her GCS (level of consciousness) was E3VtM2. Continuing treatment in the hospital was not viable, and the family opted for Medanta's ICU-at-home service.

## CARE SETUP AT HOME

The ICU-at-home team installed all necessary equipment, including a portable ventilator (Philips A-40), suction machine, oxygen concentrator, DVT pump, and cardiac monitor. An ICU-grade bed with an air mattress was arranged to ensure patient comfort.

The clinical care team included a 24x7 critical care nurse and GDA, regular home visits by Medanta doctors, virtual coordination with the primary hospital team, and sessions with a rehab therapist and speech therapist.

## OUTCOME AFTER 3 MONTHS OF HOME-BASED CRITICAL CARE

- GCS improved from E3VtM2 (very low level of consciousness) to E4V5M6 (full consciousness)
- Tracheostomy closed, cranioplasty completed successfully
- Off oxygen and ventilator support
- All lines and tubes removed
- Tolerating oral feeds and medications
- Regained ability to walk independently
- Continues to receive active rehab at home

The structured care plan helped the patient transition safely from critical care to home-based recovery, with visible improvement in health and function.
